WORKED-OUT EXAMPLE.

PART 4

Introduction	IX-1	Design of Drainage and Irrigation System in P-43/2c	IX-2	Design steps as given in volume I (page I-9) upto and including I-15):	IX-2
2.4.1 Data Collection	IX-2	2.4.2 Data Evaluation	IX-5	2.4.4 Drainage Design of the Polder	IX-7
2.4.5 Design of Drainage Sluice	IX-11	2.4.3 Irrigation design	IX-27	2.6 Design of a tidal inlet structure	IX-29

In this Volume a complete worked-out example is presented, as far as possible (b) (ad 3) (part + annex).

The worked-out example is based on the design of drainage structures for a polder in the delta area.

The basic data provided permitted, of the design of drainage and irrigation structures for a polder in the delta area.

The worked-out example is based on the design of two tidal drainage sluices for Polder - 43/2c, Patuakhali District, a scheme taken up by E.I.P. in 1984-85. For the design of two tidal drainage sluices for Polder - 43/2c, Patuakhali District, a scheme, i.e. sluice S-2 in Munchir Khal.

In the following worked-out example it should be noted that a different design drainage level has been assumed than in the BMDB design. The example furthermore only considers the southern part of the scheme, i.e. sluice S-2 in Munchir Khal.

The foundation and structural part of the try-out design of the BMDB engineer was found to be in good order and procedures followed very well. Therefore there was no need to elaborate further on this subject in the worked-out example.

The foundation and structural part of the try-out design of the BMDB engineer was found to be in good order and procedures followed very well. Therefore there was no need to elaborate further on this subject in the worked-out example.

The worked-out example is based on the design of drainage structures for a polder in the delta area.

The basic data provided permitted, of the design of drainage and irrigation structures for a polder in the delta area.

The worked-out example is based on the design of two tidal drainage sluices, the BMDB - design engineers used the draft manual as the basis.

In the following worked-out example it should be noted that a different design drainage level has been assumed than in the BMDB design. The example furthermore only considers the southern part of the scheme, i.e. sluice S-2 in Munchir Khal.

The worked-out example is based on the design of two tidal drainage sluices for Polder - 43/2c, Patuakhali District, a scheme taken up by E.I.P. in 1984-85. For the design of two tidal drainage sluices for Polder - 43/2c, Patuakhali District, a scheme, i.e. sluice S-2 in Munchir Khal.

In the following worked-out example it should be noted that a different design drainage level has been assumed than in the BMDB design. The example furthermore only considers the southern part of the scheme, i.e. sluice S-2 in Munchir Khal.

Introduction

Planimetering of the available topographic maps yields the following

b) Topographic information

(= 59.5 km) have been surveyed.

There exists a large number of internal khaals of which 37 running miles

acres = 91 ha.

Irrigation is practiced with five low lift pumps and donga over 225

was abandoned after a few years due to saline constraints (flooding).

HV were for some years grown in 50% of the area, but this practice

tides.

The boro area (12 ha) is submerged during most of the year. Aus seedlings are prepared in April-May, suffer from saline flooding during spring

Tamaan + rabi (29 ha).

Low land: 100 acres = 41 ha: Boro (12 ha) or

23% = 484 ha is triple crop, Tamaan + aus + rabi.

36% = 757 ha is double crop, Tamaan + aus or rabi.

41% = 863 ha is single crop, Tamaan.

medium land: 5200 acres = 2104 ha:

High land : 500 acres = 202 ha: Tamaan+rabi

high level is 0.30-0.60 m above medium.

Low level is 0.30 m below medium

90% is medium level

Project area : 5800 acres = 2347 ha

and as leanam dhan and monsoon period.

and do irrigate drainage construction/fresh water flooding measures

and do irrigate irrigation, spring tides January and early February

and do irrigate and damages due to saline water intrusion

and do irrigate and Tamaan grown in nearly entire area, below and

crops grown : rabi, aus, Tamaan.

from Project Report no. II: (see ANNEX IX-1)

a) Information on the area: At different times several surveys have

been carried out to determine the boundaries of the project area

1.5 m	272 ha	1517 ha	1517 ha	1517 ha	1.8 m
From the contour map it is seen that the total area is within + 1.8 m elevation.					
Total drainage area for sluice S-1 = 1251 ha. (as per notes to get drainage area)					
Total drainage area for sluice S-2 = 1517 ha. (as per notes to get drainage area)					
For area elevation curve (Sluice S-2) : (as per notes to get drainage area)					
Area below 1.5 m: 1245 ha. (rather high!) check maps.					
Area below 1.8 m: 1517 ha.					
Area below 1.5 m: 200 ha. (estimated roughly).					
Area below 1.2 m: 12 ha. (check maps).					
Highest point + 2.13 m.					
Lowest point + 1.08 m					

the following information may be used for the estimation of the water level at the construction site. It is suggested that the data be used for the estimation of the water level at the construction site.

the following cropping calendar for the area has been assumed: (see page 2.4.2 Data Evaluation)

a) Based on the available information on present agricultural use, data

of the following sources are used:

May. (see page 2.4.2 Data Evaluation)

The project report mentions saline river waters from January

to April. (see page 2.4.2 Data Evaluation)

g) Salinity measurements done in the month May showed

salinity values in the range of 2500 mg/l. (see page 2.4.2 Data Evaluation)

gauge reading. (see Project Report no. 11).

Since the Gola Chhipa gauge is very near to the project area,

were taken during two months and were correlated to the Gola Chhipa

temporary gauges installed at the proposed sluice sites which

drainage sluices. This was confirmed by the readings of two

readings from this gauge can be maintained for the tide at the

gauge reading. (see Project Report no. 11).

Since Gola Chhipa gauge is very near to the project area,

mined later on. (second half of June, first half of July).

years of records and the critical period for drainage, as determined

the lowest low water spring tide (L.L.W.) are summarized for the

on ANNEX IX-7, the highest high water spring tide (H.H.W.) and

and mean low waters (M.L.W.).

On ANNEX IX-6, the same was done for the mean high meters (M.H.W.)

determined.

On ANNEX IX-5, the fortightly mean water levels (F.M.L.) for the

years 1968/1969 the water levels have been analysed and processed

to determine the fortightly mean level. (see ANNEX IX-3 and -4).

On ANNEX IX-5, the fortightly mean water levels (F.M.L.) for the

years 1968/1969 were included in the design material. For the

f) Water levels of station Gola Chhipa (185), River Lohatia of the

Duratlon curves available in the Design Manual.

e) Rainfall and evaporation information from Patuakhalit may be used.

construction site.

irrigation water can reach all parts of the polder. The bunding of all main channels will however reduce the storage capacity.

Since the poldder is very flat with little relief, their is definite scope to use the drainage channels also as irrigation supply channels, but this requires all the main channels to be bunded so that the

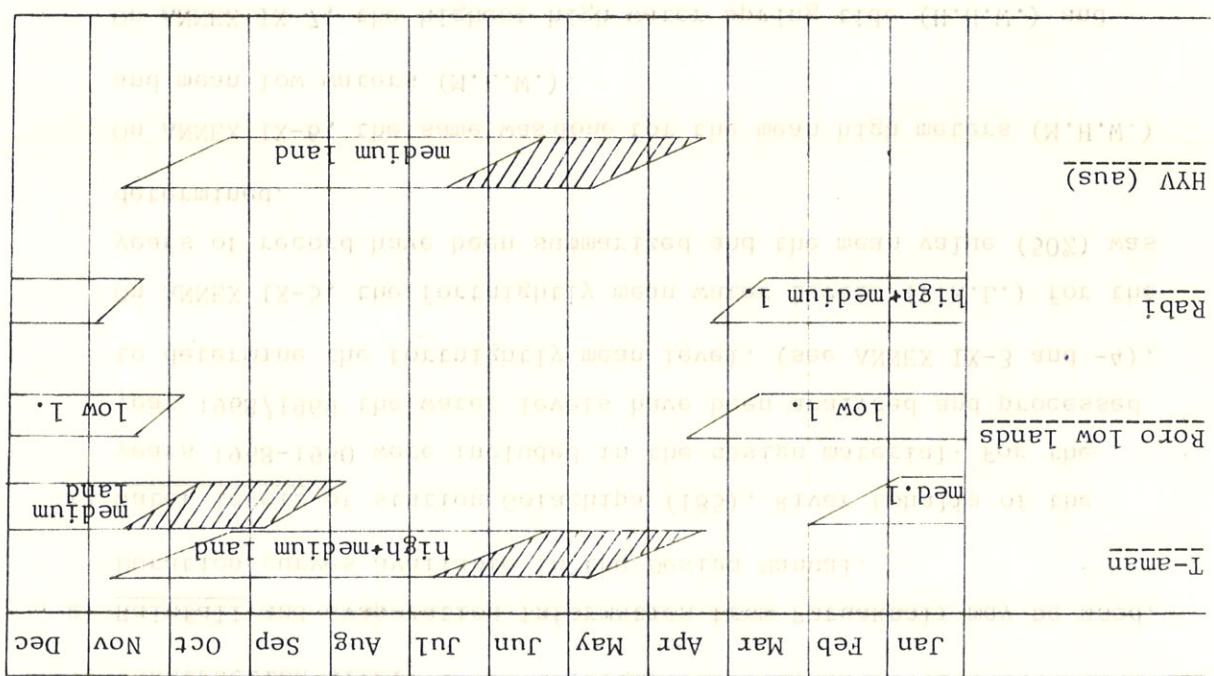

The storage area is highly dependent on the features of the agricultural use, and will be influenced by the fact if the lands are burned and if the drainage channel is buried.

cope with the restricted capacity of storage of water in the paddy fields. This drainage modulus will result in a high required sluice discharge, which in its self requires a vast storage area because otherwise the water levels in the drainage channel would drop too

However, the HVV requires a very high dragage modulus in order to avoid adhesion due to the bedload.

Because the price is to be considered as extremely high, vast areas could be cultivated with HVV. If a d.d.l. of + 1.30 m is assumed, then almost the entire area, except 100 ha could be under HVV.

From the information of the topographic maps, an area - elevation curve for the S-2 area is prepared and presented in ANNEX IX-8.

- month and each variety (area cropped with the variety).
- The drainage modulus is now determined for each variety and may not exceed 8 days.
- In the fields, the maximum duration of flooding above this level 2. Starting from the initial water level of 100 mm in the rice consider an initial water level in the rice fields of 100 mm.
- provided by the rice fields is resp. 100 mm and 300 mm if we mm for long straw varieties. The field storage that can be should not exceed 200 mm for short straw varieties and 400 mm for long straw varieties. The ground surface
1. The maximum depth of flooding on top of the surface

The criteria for the determination of the drainage modulus, as:

Plotted on ANNEX IX-11.

- a) Determine the drainage modulus for each month, May to August curves for once in 10 years rainfall and the drainage modulus are 100 for the assumed m.a.st. 1. at + 1.60 m. The rainfall duration
- 2.4.4. Drainage Design of the Polder
- drainage time T is determined according to point 2.4.4.-d of Volume I.
- Information on M.H.W., M.L.W. and F.M.L.
- fitting sinus shape for the tide curves is estimated from the information is available on the shape of the tide curve, the best tide curve is determined on ANNEX IX-10. Since no additional information is available on the shape of the tide curve, the best
- For every fortnightly period, the drainage time T of the average tide and M.W. and M.L. levels.

from ANNEX IV-5 the F.M.L. is plotted on ANNEX IX-9, together with for long straw varieties which will be grown in the polder.

level will be at + 1.60 m and that the drainage modulus is determined drainage level will be at + 1.30 m and the maximum allowable storage In the following, it has been assumed arbitrarily that the design on optimum has to be found based on the above considerations.

In order to be on the conservative side, since only scarce information is available, the design will continue using the design discharge for the case of the drainage channel is available, the total drainage requirement would be $32.57 \text{ m}^3/\text{s}$ in the second half of August.

If we consider 50% of the area under short straw varieties then the total drainage requirement would be $32.57 \text{ m}^3/\text{s}$ in the second half of August.

If we consider 50% of the area under long straw varieties. In order to be on the conservative side, since only scarce information is available, the design discharge for the case of the drainage channel is available, the total drainage requirement would be $32.57 \text{ m}^3/\text{s}$ in the second half of August.

$aQ_{av} = 23.24 \text{ m}^3/\text{s}$ in case the whole polder is considered under long straw varieties.

It appears that the second half of June is the most critical period with

* 8-day criteria critical.

Q in section *) 15.8 - 1.0 = 14.8 m - 0.25 m = 14.55 m

Q in section *) 15.8 - 1.0 = 14.8 m - 0.25 m = 14.55 m

In order to plot the delivery curves for the drainage channel, the normal waterdepths for a range of discharges is furthermore calculated according to the same procedure.

The normal waterdepths for a range of discharges is furthermore calculated according to the same procedure.

In order to plot the delivery curves for the drainage channel, the normal waterdepths for a range of discharges is furthermore calculated according to the same procedure.

The normal waterdepth for each section is now calculated using

Manning's formula and the above information.

The normal waterdepth for each section is now calculated using

graphic map : $41 \text{ ha} = 41000 \text{ m}^2$ to be submerged at the level of
the drainage channels from the top -
Estimate area of low pockets, which are in open connection with
8 m at + 1.50 m level and 7.5 m at + 1.30 m level.
Estimate the average surface width of the remaining channels to be

$$\begin{aligned} & \text{Branch a - } a^* = 7880 \text{ m} \\ & \text{Branch e - } e^* = 1660 \text{ m} \\ & \text{remaining channels} = 23060 \text{ m} \\ & \text{total} \quad 32600 \text{ m} \end{aligned}$$

$$\text{Estimate for the S - 2 area: } \frac{1517+1251}{1517} \times 59,500 = 32,600 \text{ m}.$$

From the Project Report it is known that total length of internal
channels in the area is 37 miles ($= 59,500 \text{ m}$) for the whole area.

+ 1.50 is 24 m, at + 1.30, 22.5 m.

Branch channel $e - e^*$, length 1660 m, estimated surface width at

$$\begin{aligned} & \text{area} + 1.30 \text{ m} \quad 50,071 \quad 29,432 \quad 25,400 \quad 13,688 \quad 34,974 \quad 29,260 \\ & \text{at} + 1.30 \text{ m} \quad 31.1 \quad 28.3 \quad 25.4 \quad 23.2 \quad 20.1 \quad 15.4 \\ & \text{surface width} \quad 32.3 \quad 29.5 \quad 26.6 \quad 24.4 \quad 21.3 \quad 16.6 \\ & \text{at} + 1.50 \text{ m} \quad 80.9 \quad 82.8 \quad 84.9 \quad 10.1 \quad 85 \end{aligned}$$

$$\begin{aligned} & \text{average bottom width} \quad 6.75 \quad 6.25 \quad 5.25 \quad 4.50 \quad 3.50 \quad 2.00 \\ & \text{average bottom level} \quad -2.76 \quad -2.37 \quad -2.06 \quad -1.82 \quad -1.47 \quad -0.93 \end{aligned}$$

$$\begin{aligned} & \text{slope} \quad 1 : 3 \\ & \text{length} \quad 1610 \quad 1040 \quad 1000 \quad 590 \quad 1740 \quad 1900 \end{aligned}$$

section area - the area

+ 1.30 and at the end of the drainage period T.

of the drainage channels is determined at the level of + 1.50 and

d) From the schematization of the drainage channel the surface area

+ 1.30 and 152 ha (10% of the area is Low Land) to be submerged and in open connection with the drainage channels at the level of + 1.50 m.

With the above information the storage capacity curve of the drainage channel and connected Low Lands can be constructed.

at the level of + 1.50 + 1.30 + 1.00
 area of main dr. channel 6192,281 m² 182,825 900,000 168,600
 branch channel 39,840 37,350 33,600
 remaining channels and roads 184,480 172,950 155,600
 creeks 1,520,000 410,000
 low lying areas 1,936,600 m² 803,125 m² 357,800 m²
 total 1,517 ha

It is further estimated that when the drainage level would be reduced to + 1.00 m (below the lowest polder ground level elevation) only the channels will draw water. The surface area at this stage is established by linearly interpolating the data from the + 1.50 and + 1.30 level. The results are plotted in ANNEX IX-15.

The water level in the polder at the end of the drainage period is estimated as follows.

The area : 1517 ha.
 drainage modulus 65 $\frac{1}{2}$ mm/day
 area drainage requirement: $1517 \times 10^4 \times 0.0655 = 993.635 \text{ m}^3/\text{day}$
 = 11.50 m³/s
 sluice drainage requirement: $23,24 \text{ m}^3/\text{s}$
 storage decrease in drainage channel system:
 during one drainage period.
 $(23,24 - 11.50) \times T = 11,74 \times 6,15 \text{ hrs} = 259.924 \text{ m}^3/\text{tide}.$
 Iterate with the help of ANNEX IX - 15 to the water level H_t at which 259.924 has been evacuated.

Starting from the level of $\frac{1}{2}$ (m.a.s.t.l. + d.d.l.)

during the second half of June. due to rainfall was 23.24 m^3/s

a) The design discharge as calculated under 2.44 - (c) was 23.24 m^3/s

2.5 Design of Drainage Sluice

The average headwater at the sluice during the drainage period is thus $(1.18 + 0.06) = 0.62 \text{ m}$. The sluice invert level was established at -0.75 m . The average sluice during the drainage period is thus $(-0.62 + / - 0.75) \approx + 1.40 \text{ m}$.

Condition through the sluice during the drainage period T is thus $(e + 0.62 + / - 0.75) = + 0.62 \text{ m}$. The average headwater at the sluice during the critical flow is

$$q = 1.35 \times (1.4) \frac{1.5}{2} = 2.24 \text{ m}^2/\text{s}$$

The average sluice width w is thus:

$$w = \frac{q}{Q} = \frac{2.24}{23.24} = 0.10138 \text{ m}$$

Thus the width of the sluice is:

$$w = 0.10138 \text{ m} \times 2.24 = 0.226 \text{ m}$$

Thus the required average sluice discharge was $23.24 \text{ m}^3/\text{s}$.

As summing flow condition (5), the flow through the sluice can be expressed as:

$$Q = 1.35 \times 10.38 \times (H_x + / - 0.75 /) 1.5$$

Where $Q_f = Q_{s1}$ and $H_f = 1.60$, it yields for $H_x = + 0.90 \text{ m}$ and $Q_f = 29.7 \text{ m}^3/\text{s}$.

This curve is plotted in ANNEX IX-16. Interpolating in 15.04, $H_x = 0.94 \text{ m}$.

Check flow condition (5) o.k. if $h_{cr} < h_2$

$$h_2 = / - 0.75 / + 0.21 = 0.96 \text{ m}$$

Therefore step c) has to be repeated for another flow condition:

c) Choose flow condition (4): $H_f = H_x = 0.94 \text{ m}$

Therefore $Q_f = Q_{s1}$ and $H_f = 1.60$; it follows $H_x = + 0.90 \text{ m}$ and $Q_f = 29.7 \text{ m}^3/\text{s}$.

Check flow condition (5) does not prevail!

$$h_{cr} = \sqrt{\frac{g}{q^2}} = 0.94$$

$$h_{cr} = \sqrt{\frac{g}{q^2}} = 0.94$$

from ANNEX IX-16: $Q_{max} = 30 \text{ m}^3/\text{s}$

Step c) could now be repeated again to correct the assumptions on H_x and Q_{sl} .

and $Q_1 = Q_{sl} = 30.6$, $H_x = 0.79$ m.

This curve is plotted in ANNEX IX-16 and yields for $H_x = +1.60$

$$Q = 0.82 \times 7.46 \times 1.49 \times \sqrt{2g(H_x - 0.21)}$$

$$h_2^2 = +0.21 + I.L. = 1.49$$

$$Q = 0.82 \times 7.46 \times h_2 \times \sqrt{2g(h_1 - h_2)}$$

assume flow condition (4) :

e) Check sluice velocity at maximum drainage discharge:

$$h_{cr} = \sqrt{\frac{q^2}{g}} = 1.00$$

(4) is o.k.

Check flow condition : $q = 3.11 \text{ m}^2/\text{s}$

$$\text{required width} : b = \frac{23.24}{3.11} = 7.46 \text{ m.}$$

$$q = 0.82 \times 1.62 \times \sqrt{2g(1.90 - 1.62)} = 3.11 \text{ m}^2/\text{s.}$$

$$h_2^2 = +0.34 + I.L. = 1.62 \text{ m.}$$

$$h_1^2 = +1.90$$

$$q = 0.82 \times h_2 \times \sqrt{2g(h_1 - h_2)}$$

assume flow condition (4) :

average M.L.W. is at $+0.34$.

I.L. = $-1.28 \rightarrow H_x = +0.62 + / - 1.28 / = 1.90 \text{ m.}$ (check stability)

$Q_{av} = 23.24 \text{ m}^3/\text{s}$ is 0.62 m.

d) The width of the sluice follows now from: average H_x during

$$h_2^2 = 1.49$$

$$h_{cr} = \sqrt{\frac{q^2}{g}} = 1.25$$

(4) is o.k.

check flow condition : $h_{cr} = \sqrt{\frac{q^2}{g}} = 1.25$

I.L. = -1.28 m PWD.

$$q = 0.82 \times (0.21 + / I.L. /) \times \sqrt{2g(0.86 - 0.21)} \leq 4.375 \text{ m}^3/\text{s}$$

Maximum draintage capacity :

$$\text{invert Level} : - 1.35 \text{ m}$$

Therefore final choose for :

$$q = 0.82 \times 1.60 \times \sqrt{2g (2.17 - 1.60)} = 4,385 \text{ m}^2/\text{s} \approx 4,375.$$

$$h_2 = + 0.21 + I.L. = 1.60 \text{ m.}$$

$$h_1 = + 0.78 + I.L. = 2.17 \text{ m.}$$

$$q = 0.82 \times h_2 \times \sqrt{2g (h_1 - h_2)}$$

check maximum velocity during extreme draintage :

$$h_2 = 1.73$$

$$h_{cr} = \frac{3}{2} \frac{q_2}{g} = 1.04$$

$$q = 0.82 \times 1.73 \times \sqrt{2g (2.01 - 1.73)} = 3,32$$

$$h_2 = + 0.34 + / - 1.39 / = 1.73 \text{ m.}$$

$$h_1 = + 0.62 + / - 1.39 / = 2.01 \text{ m.}$$

$$q = 0.82 \times h_2 \times \sqrt{2g (h_1 - h_2)}$$

for average draintage flow:

$$\text{for extreme conditions: } h_2 = 1.60$$

$$\text{check flow conditions: } h_{cr} = \frac{3}{2} \frac{q_2}{g} = 1.24$$

$$\text{Invert Level} = 1.39 : q = 0.82 \times 1.39 \times \sqrt{2g (2.01 - 1.39)} = 3,31$$

$$\text{yields for } H_t = 1.60, Q_t = Q_{sl} = 30,7 \text{ m}^3/\text{s}. H_x = 0.78.$$

$$q = 0.82 \times 7.07 \times h_2 \times \sqrt{2g (H_x - 0.21)}$$

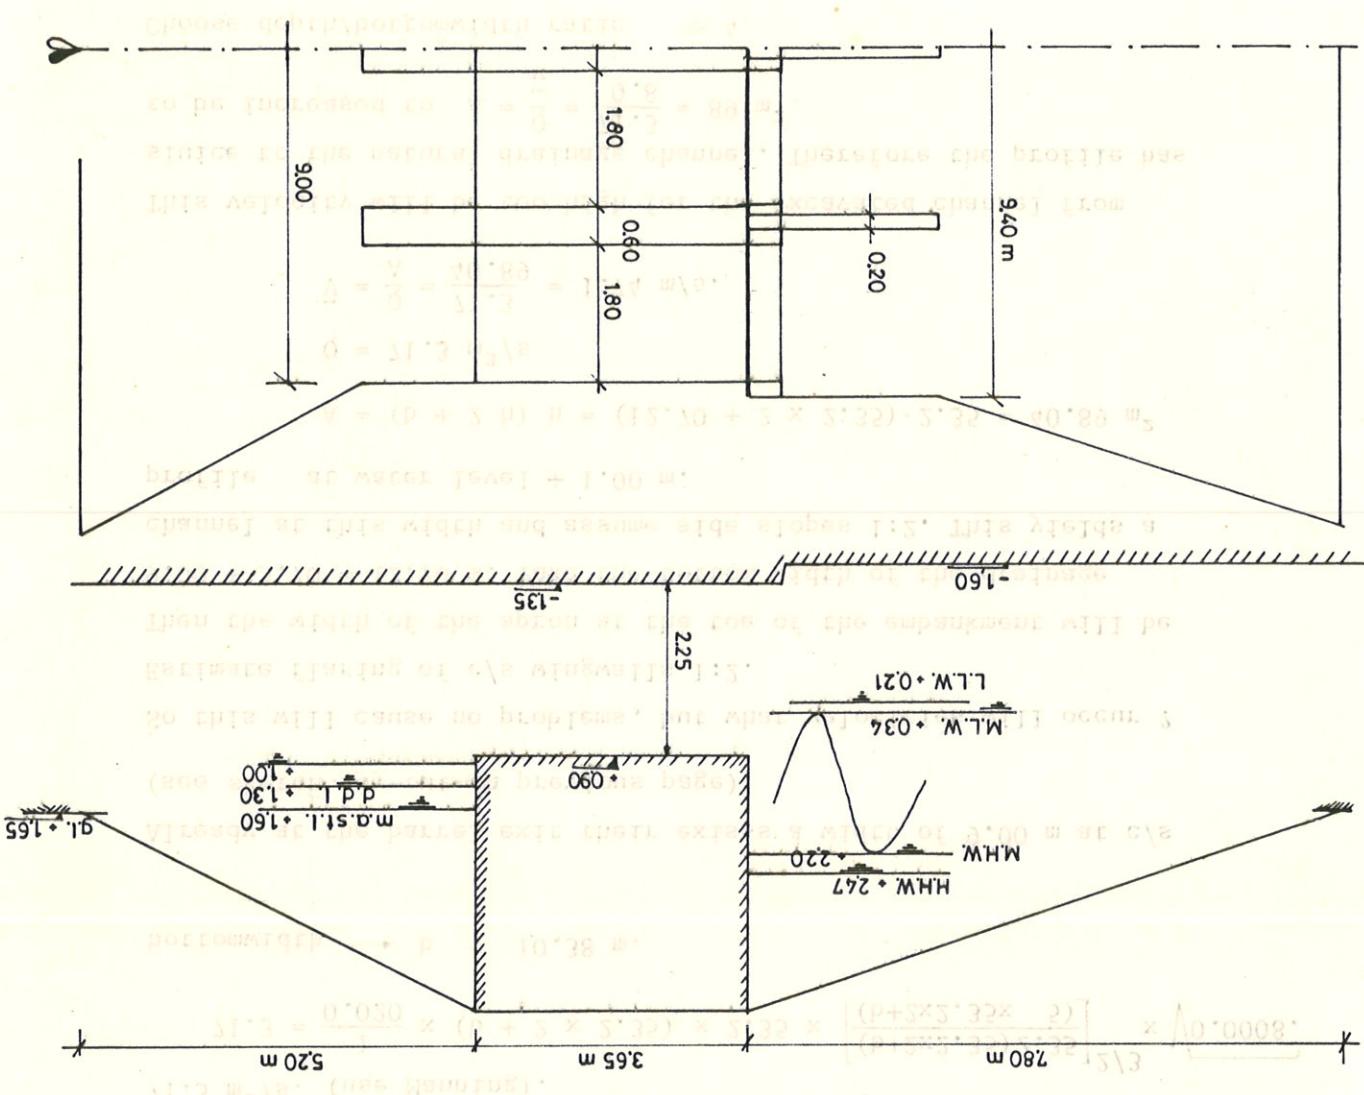

$$h_2 = + 0.21 + I.L. = 1.58$$

$$q = 0.82 \times 7.07 \times h_2 \times \sqrt{2g (h_1 - h_2)}$$

The extreme velocities in the sluice will then be :

$$\text{ponding sluice width of } 7.07 \text{ m.}$$

This will ultimately lead to an invert level of - 1.37 and a corres-

g) A sketch Lay-out is now made:

The centering of the barrel now comes at + 0.90 m.
Laterer size for the barrel height, c.q. $d = 2.25 \text{ m}$.
Close to the sluice is considerable, it is chosen to adopt the
Since draw down effect on the water level in the drainage channel

$$H = + 1.30 + / - 1.35 / = 2.65 \rightarrow d \leq 2.21$$

If d.d.l. is chosen :

$$\text{Criteria: } H \leq 1.2 d. \quad d \leq \frac{H}{1.2} = \frac{2.95}{1.2} = 2.46 \text{ m.}$$

From, m.a.st.l. to invert level is + 1.60 + / - 1.35 / = 2.95 m.

f) Determination of the barrel - height

Choose depth/bottomwidth ratio ≈ 4 .

This velocity will be too high for the excavated channel from sluice to the natural drainage channel. Therefore the profile has to be increased to $A = \frac{Q}{V} = \frac{71.3}{0.8} = 89 \text{ m}^2$.

$V = \frac{Q}{A} = \frac{71.3}{40.89} = 1.74 \text{ m/s}$

$Q = 71.3 \text{ m}^3/\text{s}$

$A = (b + 2h)h = (12.70 + 2 \times 2.35) \cdot 2.35 = 40.89 \text{ m}^2$

profile at water level + 1.00 m.

channel at this width and assume side slopes 1:2. This yields a width of $9.00 + 3.70 = 12.70 \text{ m}$. Take the bottom width of the drainage embankment will be

Then the width of the apron at the toe of the embankment will be estimated flaring of c/s wingwalls 1:2.

So this will cause no problems, but what velocities will occur?

(see sketch lay-out on previous page).

Already at the barrel exit there exists a width of 9.00 m at c/s

bottomwidth $b = 10.38 \text{ m}$.

$71.3 = \frac{1}{0.020} \times (b + 2 \times 2.35) \times 2.35 \times \sqrt{\frac{(b+2x2.35)(2.35)}{2/3}} \times \sqrt{0.0008}$

$71.3 \text{ m}^3/\text{s}$. (use Manning).

Area of drainage channel required to convey the flushing flow of A (8)

$$V = \frac{Q}{b \times h} = \frac{4 \times 1.80 \times 2.25}{71.3} = 4.4 \text{ m/s}$$

velocity in the barrel: $b = p.c$ (digested barrel and total area)

$$Q = 0.82 \times (4 \times 1.80 \times 2.25) \times \sqrt{2g(2.47 - 1.00)} = 71.3 \text{ m}^3/\text{s}$$

$$C_1 = 0.82$$

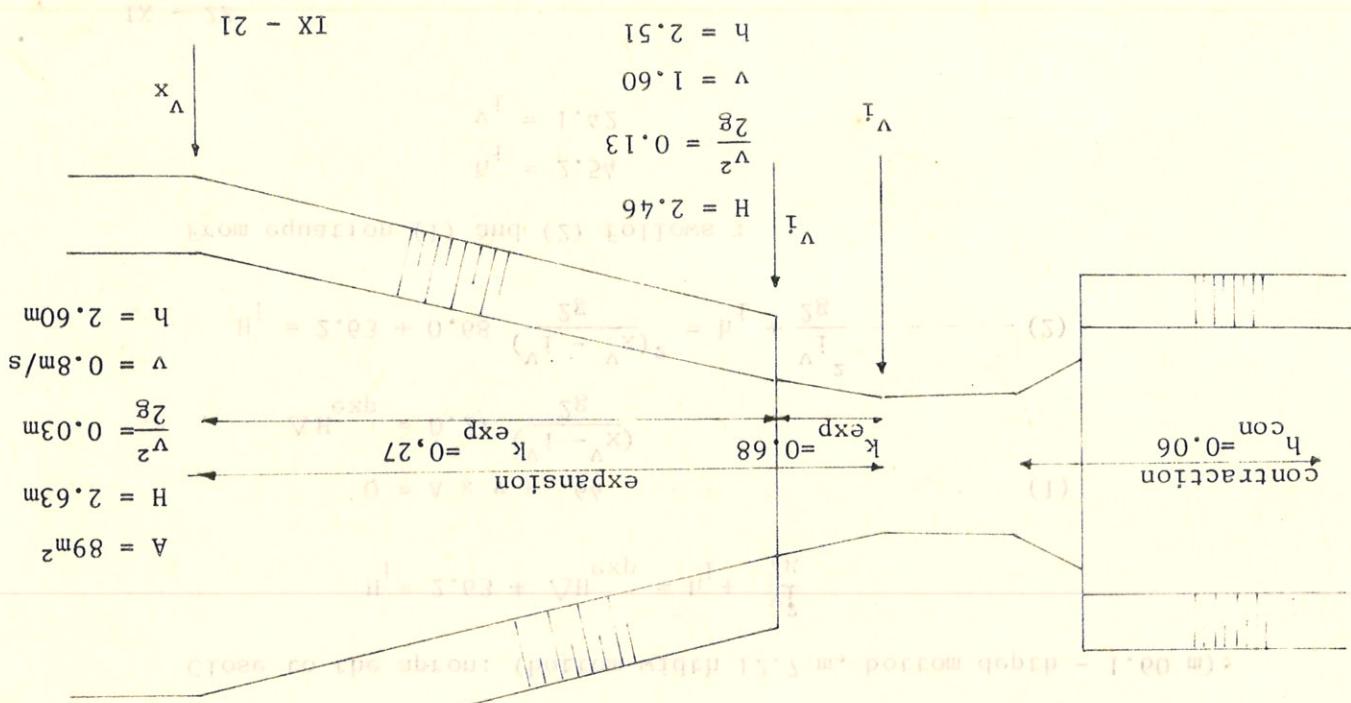

$$Q = C_1 \cdot A \cdot \sqrt{2g \cdot \Delta H}$$

$$\text{Assume full barrel flow : flow condition (1)}$$

$$\text{Polderwater at } +1.00 \text{ m.}$$

$$\text{Riverwater at } +2.47 \text{ m.}$$

h) Check maximum velocities during flushing operations: not specified (1)

See ANNEX IX-17.

The velocity head at river side can be neglected since velocities are very small. Energy head is therefore assumed to be water level (+ 2.47 m) at the r/s and + 1.00 + 0.03 = 1.03 m at c/s.

Velocity head in the channel is then: $\frac{V^2}{2g} = 0.03 \text{ m}$. The connection channel is designed at $b_0 = 29.0 \text{ m}$ giving a profile side slopes 1:2.

The connecting channel is designed at $b_0 = 29.0 \text{ m}$ giving a profile of 89 m^2 at water level + 1.00 m and bottom depth - 1.60 m with bottom depth is then at + 1.00 - $\frac{89}{29.0} = -2.85 \text{ m}$. If maximum attainable bottom depth is assumed to be - 1.60, then the bottom width of the connection channel should be $b = 29.0 \text{ m}$.

$$A = (b + 2h) h = (b + \frac{2b}{4}) \cdot \frac{b}{4} = 89 \rightarrow b = 15.40 \text{ m.}$$

$$V_i = 2.54$$

$$V_i = 1.42$$

From equation (1) and (2) follows :

$$H_i = 2.63 + 0.68 \frac{(V_i - V_x)^2}{2g} = h_i + \frac{V_i^2}{2g} \quad \dots \dots \dots (2)$$

$$\Delta H_{\text{exp}} = 0.27 \frac{(V_i - V_x)^2}{2g}$$

$$Q = A \times V = 64 \quad \dots \dots \dots (1)$$

$$H_i = 2.63 + \Delta H_{\text{exp}} = h_i + \frac{V_i^2}{2g}$$

Close to the apron: (bottom width 12.7 m, bottom depth - 1.60 m):

$$H = 2.63.$$

$$h = 2.60, A = 89, Q = 64, V = 0.72 \text{ m/s} \quad \frac{V^2}{2g} = 0.03,$$

In the drainage channel (bottom width 29 m, bottom depth - 1.60 m):

ANNEX IX-17 the water levels can be plotted.

By iteration it is found that the best fit $Q = 64 \text{ m}^3/\text{s}$. Now on

We started with $a = 71.3 \text{ m}^3/\text{s}$.

$$Q_{\text{box}} = 0.82 \times (4 \times 1.80 \times 2.25) \times \sqrt{2g(1.11)} = 62.0 \text{ m}^3/\text{s}.$$

IX-17 XENIA 992

$$\Delta H_{\text{box}} = 1.11$$

$$\Delta H_{\text{tot}} = 0.06 + \Delta H_{\text{con}} + 0.27 \quad \text{at head loss and bottom level rise}$$

$$\Delta H_{\text{tot}} = 1.44 = \Delta H_{\text{con}} + \Delta H_{\text{box}} + \Delta H_{\text{exp}}$$

$$\Delta H_{\text{exp}} = 0.68 \times \frac{(4.4 - 1.60)^2}{2g} = 0.27 \text{ m}.$$

$$\Delta H_{\text{con}} = 0.06 \quad \text{at head loss and bottom level rise}$$

$$\Delta H_{\text{box}} = 0.06 \quad \text{at head loss and bottom level rise}$$

$$V_i = \frac{(12.7 + 2 \times 2.51) 2.51}{71.3} = 1.60 \text{ m/s}.$$

$$V_i = V_o = \frac{H}{Q} = \frac{71.3}{4 \times 1.8 \times 2.25} = 4.4 \text{ m/s}.$$

$$V_i = V_o = \frac{Q}{A} = \frac{4 \times 1.8 \times 2.25}{0.21} = 40.4 \text{ m/s}$$

$$\text{First approximation for expansion losses at c/s apron : } (a + d) = A$$

$$Q = 0.495 \times 7.2 \times 2.25 \times \sqrt{2g \times 3.82} = 69.4 \text{ m}^3/\text{s}.$$

$$\frac{H_o}{d} = \frac{3.82}{2.25} = 0.589 \quad \leftarrow C_3 = 0.495 \text{ is nondimensional}$$

$$Q = C_3 \times 4 \times 1.8 \times 2.25 \times \sqrt{2g \times H_o}$$

make too much difference as can be checked with :
will be under flow condition ③ For the discharge this will not

This means that flow condition ① will not prevail. Therefore flow

Water level (h_i) at $1.92 - 1.35 = +0.57$.

Box ceiling at +0.90

Barrels at c/s the elevation is below the ceiling of the box, i.e.;

Plotting of the water levels shows that where the water leaves the

At x-section III: $H_i^o = 3.77 = h_i^o + \frac{2g}{V_i^o}$

$h_i^o = 3.60 \text{ m}$: smooth

$V_i^o = 1.81 \text{ m}^3/\text{s}$: smooth

$\frac{V_i^o}{h_i^o} = \frac{(h_i^o + 0.25) \times 9.40}{64}$

$V_i^t = \frac{h_i^t \times 9}{64}$

$h_i^t = 1.92 \text{ m. surface at}$

At x-section I: $H_i^t = 2.62 = h_i^t + \frac{2g}{V_i^t}$

$V_i^t = 3.70 \text{ m/s}$: smooth

$\frac{V_i^t}{h_i^t} = \frac{h_i^t \times 9}{64}$

$h_i^t = 3.77 \text{ m. surface at}$

$H_i^t = H_i^o - \Delta H = 3.82 - 0.05 = 3.77 \text{ m.}$

To affirm that total head is equal to sum of all heads at 1.35 m Level).

If yields $H_i^t = H_i^o + \Delta H_{exp} = 2.40 + 0.22 = 2.62 \text{ m}$ (measured from -

$$Q = 64 \text{ m}^3/\text{s}$$

$$V_i^t = 1.42 \text{ m/s.}$$

$$\Delta H_{exp} = 0.05$$

$$\frac{V_i^t}{\Delta H_{exp}} = \frac{64 \times 4x1.8x2.25}{2g} = 1 = 3.95 \text{ m/s.}$$

$$\Delta H_{exp} = 0.68 \times \frac{(3.91 - 1.42)^2}{2g} = 0.22$$

For the approach the calculation continues :

$H_i^t = 2.65$ (measured from - 1.60 m Level).

$\Delta H_{exp} = 0.02$ $\frac{dx}{dt} = Q = V \text{ at this point}$

$\frac{dx}{dt} = 0.02 \frac{dx}{dt} = Q = V \text{ at this point}$

$0.86 \times 2g = 0.11$

$0.86 \times 2g \times 1.42 \times 2.25 \times d \text{ little base } (1.42 - 1.60) = 0.11$

to add V_i^t to basic component of little tanked and in the diff.

Velocity at channel section (bottom width 29 m, bottom depth - 1.60 m):

In this case a combination of brick blocks pitching and mattress construction is chosen.

size of bottom armour units : 550 mm. If it is assumed to be

follows:

The flow velocity at the end of the apron is then calculated as

The flaring of the wingwalls of the c/s apron should now be $\frac{1}{3}$.

transition to the connecting channel profile is made.

more advisable to extend the floor with another 3 m before the

the barrel to the c/s toe of the embankment/c.d. apron. It is there-

tion extends up to 7 m if the jump is measured from the middle of

i) The protection provided by the barrel and apron/wingwall construct-

and since $d^2 = (+1.00 + / - 1.35 /) = 2.35$, $L = 4.2 \times 2.35 = 9.87 \text{ m}$

From Figure V-4.16 follows $\frac{L}{d^2} = 4.2$

halfway the barrel to a distance L downstream.

A turbulent jump-like water surface will develop from approximately

and Froude number : $F = \sqrt{\frac{V}{gh}} = 1.90$.

The velocity of flow will be $V = \frac{Q}{b \times h} = \frac{4 \times 1.8 \times 1.38}{69.4} = 6.98 \text{ m/s}$

$C_c \times d$ (see Figure V-3.3) and will be $2.25 \times 0.613 = 1.38 \text{ m.}$

But the flow in the barrel will be contracted to a depth of

$$A = (29 + 2 \times 2.38) \times 2.38 = 80.3 \text{ m}^2$$

$$h = (-1.35/ + 0.78) = 2.13 \text{ m.}$$

$$Q = 30.8 \text{ m}^3 \quad \frac{V^2}{2g} = 0.01 \quad H = 2.14 \text{ m.}$$

$$V = 0.38 \text{ m/s}$$

IX - 25

In the drainage channel : व्हाइट ड्रैग्नेज चैनल :

The water levels in the sluice can be calculated.

$$h_2 = (1.35 + 0.21) = 1.56.$$

$$h_{cr} = \sqrt{\frac{q^2}{g}} = 1.23 \text{ m}$$

$$q = 4.28 \text{ m}^2/\text{s}$$

$$Q = 30.8 \text{ m}^3/\text{s}$$

$$= 0.82 \times 7.20 \times (1.35 + 0.21) \times \sqrt{2g(0.78 - 0.21)}$$

$$Q = C_3 \times A \times h^2 \times \sqrt{2g(h_1 - h_2)}$$

Flow condition (3) :

The flow through the sluice is shown on ANNEX IX-18.
Water level at r.s. : L.L.W. = + 0.21 m.
Downstream at the sluice $H_x = + 0.78 \text{ m.}$
 Q_{max} is determined as $Q = 30.8 \text{ m}^3/\text{s}$
Polderwater level $H_1 = + 1.60$

j) Velocities during maximum drainage operations

Use full size bricks (5 kg) or furnace burns for mattress ballasting.

$$V = 1.56 \text{ m/s} \quad \text{diameter } 180 \text{ mm} \quad (\Delta = 0.8)$$

$$V = 0.8 \text{ m/s} \quad \text{diameter } 50 \text{ mm} \quad (\Delta = 0.8)$$

Apply mattress with unit weights of ballast material:

Remaining transition zone upto channel bottom width of 29 m :

long : 10 m from the end of the apron.

Placed on its side, to improve bottom roughness). Make this section placed in a "detted" pattern are to be applied. (alternating blocks 12.7 m ($V = 1.56 \text{ m/s}$) a brick block pitching with units of 81 kg, from end of apron ($V = 2.63 \text{ m/s}$) upto where channel bottom is

$$Q = (12.7 + 2h) h \times V, yielding. \quad V = 1.56 \text{ m/s}, h = 2.51$$

$$1.60 \text{ m}) : H = 2.63 + 0.27 \left(\frac{V - 0.78}{2g} \right)^2 = h + \frac{V^2}{2g}.$$

Velocity at channel section (bottom width 12.7 m, bottom depth -

For this drop of flow no specific energy dissipators are required.

The actual waterdepth downstream of the sluice is + 0.21 m.

$$= (1.64 - 1.35) = 0.29 \text{ m}$$

$$h = 1.64 \text{ m.}$$

$$H = h + 0.03 \text{ m}$$

$$\Delta H_{\text{exp}} = 0.25 \text{ m}$$

$$V^2 = 1.03 \text{ m/s}$$

$$Q = 14.7 \times (h + 0.25) \times V = 30.8 \text{ m}^3/\text{s}$$

$$V^2 = 0.05 \text{ m}^2/\text{s}$$

$$(1.94) - 0.60 \left(\frac{V^2}{2g} - \frac{V_1^2}{2g} \right) = h + \frac{V^2}{2g}$$

$$H - \Delta H_{\text{exp}} = h + \frac{V^2}{2g}$$

Expansion Losses :

$$9.40 + 5.30 = 14.70 \text{ (see ANNEX IX-18).}$$

At the end of the apron the profile has then widened to :

$$\frac{3F}{11} = \frac{1}{2.1} \approx \frac{1}{2} \text{ m}$$

Choose filtering of r/s wingwalls : $\frac{3F}{11} = \frac{1}{2}$. Imposed at 0.0

$$Froude number : F = \frac{\sqrt{g} h}{2.74} = \frac{\sqrt{9.8 \times 1.50}}{2.74} = 0.70.$$

$$H = 1.56 + 0.38 = 1.94 \text{ m.}$$

$$\frac{V^2}{2g} = 0.38 \text{ m.} \quad \text{m of transition}$$

$$V = \frac{1.56}{4.28} = 2.74 \text{ m/s}$$

At the box - exit : measured from outside surface upstream

$$H = 2.13 \text{ m.} \quad \text{m of transition}$$

$$\Delta H_{\text{con}} = 0.01 \text{ m}$$

$$\frac{V^2}{2g} = 0.15 \text{ m}$$

$$Q = 30.8 = V \times h \times 9.00$$

$$V = 1.73 \text{ m/s}$$

$$2.14 - 0.06 \left(\frac{V^2}{2g} \right) = h + \frac{V^2}{2g}$$

$$H - \Delta H_{\text{con}} = h + \frac{V^2}{2g}$$

$$Before the box entrance : \frac{5(87.0 - 9)}{15.0 + 15.5} = H = 0.061 \text{ m}$$

Soil will be designed. Irrigation supply level is chosen at

c) As an example an irrigation unit in the south-east part of the

b) Tide curve for second half of May is given on ANNEX IX - 10.

$$= 0.498 \times 10000 \text{ m}^3/\text{ha/month} = 4980 \text{ m}^3/\text{ha/month}$$

a) Irrigation supply requirement as established above : 498 mm/month

2.6 Design of a tidal inlet structure

Since no information on this is available, the part of the design will be omitted.

The size of the irrigation unit has been established.

ii) The design of irrigation channel network can only proceed after

the size of the irrigation unit has been established.

iii) The irrigation supply requirement is the $319 \times \frac{1}{1+0.8} = 498$ mm/month for the month of May.

i) The irrigation supply requirement is the $319 \times \frac{1}{1+0.8} = 498$

* as determined above.

ET _c	percolation	land preparation	irrigation	drainage	total
Apr	May	Jun	Jul	Aug	Sep
142	146	224	125	140	153
31	30	31	31	31	31
200	200	200	200	200	200
81	- 279	- 330	- 324	- 161	
$2/3 ET_c + 2/3 \times \text{perc.} + 1 \cdot p-r = 319*$	38	40	40	40	

The net irrigation requirement then becomes.

and percolation an amount of 200 mm per month is applied.

For the other months when rain exceeds the requirement for crops

319 mm.

Water requirement for land preparation during May is $225/0.8 =$

convoyance losses : 0.8 : 15 = 12.5 mm.

embankment :	crest width	12'	=	3.65 m	: assumed dimensions
embankment :	slope c/s	1:2	across	5.20 m	height + 1.62 m = 6.82 m
embankment :	slope c/s	1:4	across	5.31 m	ground level : + 5.31 = + 1.62 m
length of pipe through embankment at g.l. :	4 x (5.2 - 1.62) + 3.65 + 2 x (5.2 - 1.62) = 25.13 m.				length of pipe through embankment at g.l. : 25.13 m.
consider flow condition ① : both in and outlet submerged:	4	25.13	3.65	5.20	length of pipe through embankment at g.l. : 25.13 m.
for a 12" absents cement pipe of 25.13 m length C_1 is calculated according to Table V - 3.1.	$C_1 = \sqrt{\frac{1}{1 + \frac{2 \times 25.13 \times (0.013)^2 \times 9.8}{0.4983}}}$	$R = 0.0773$	$A = 0.074 \text{ m}^2$	$D = 0.3048 \text{ m}$	$Q = 0.4983 \times 0.074 \times \sqrt{2g \times \Delta H}$
for a 12" pipe to discharge 1200 l/s at a water level of 1.62 m. For the tide curve is divided in portions of 1800 sec. starting left	$Q = 0.1632 \cdot \sqrt{\Delta H}$	ΔH	$Q = 0.1632 \cdot \sqrt{2g \times \Delta H}$	ΔH	average value of the riverside water level is determined.
the water level at c/s is assumed stagnant at the irrigation					supply level, which is chosen at a level of 1.65 and + 1.80 m.
the tide curve is divided in portions of 1800 sec. starting left					supply level, which is chosen at a level of 1.50 and + 1.65 and + 1.80 m.
the water level at c/s is assumed stagnant at the irrigation					water level, which is chosen at a level of 1.50 and + 1.65 and + 1.80 m.
irrigation volumes: varying at each tide for various water levels					water level, which is chosen at a level of 1.50 and + 1.65 and + 1.80 m.
12" pipe to carry deep-drainage discharge from the embankment area					water level, which is chosen at a level of 1.50 and + 1.65 and + 1.80 m.

The water level at c/s is assumed stagnant at the irrigation supply level, which is chosen at a level of 1.65 and + 1.80 m.

The tide curve is divided in portions of 1800 sec. starting left and right from the moment of high water and for each portion an average value of the riverside water level is determined.

The tide curve is divided in portions of 1800 sec. starting left and right from the moment of high water and for each portion an average value of the riverside water level is determined.

$$Q = 0.4983 \times 0.074 \times \sqrt{2g \times \Delta H}$$

$$R = 0.0773$$

$$A = 0.074 \text{ m}^2$$

$$D = 0.3048 \text{ m}$$

$$C_1 = \sqrt{\frac{1}{1 + \frac{2 \times 25.13 \times (0.013)^2 \times 9.8}{0.4983}}}$$

according to Table V - 3.1. $Q = C_1 \cdot A \cdot \sqrt{2g \cdot \Delta H}$

for a 12" absents cement pipe of 25.13 m length C_1 is calculated

consider flow condition ① : both in and outlet submerged:

$$4 \times (5.2 - 1.62) + 3.65 + 2 \times (5.2 - 1.62) = 25.13 \text{ m.}$$

length of pipe through embankment at g.l. :

$$\text{ground level : } + 5.31 = + 1.62 \text{ m.}$$

slope c/s : 1:2 across river and addition 1.62 m. for

$$r/s - \text{slope } 1:4$$

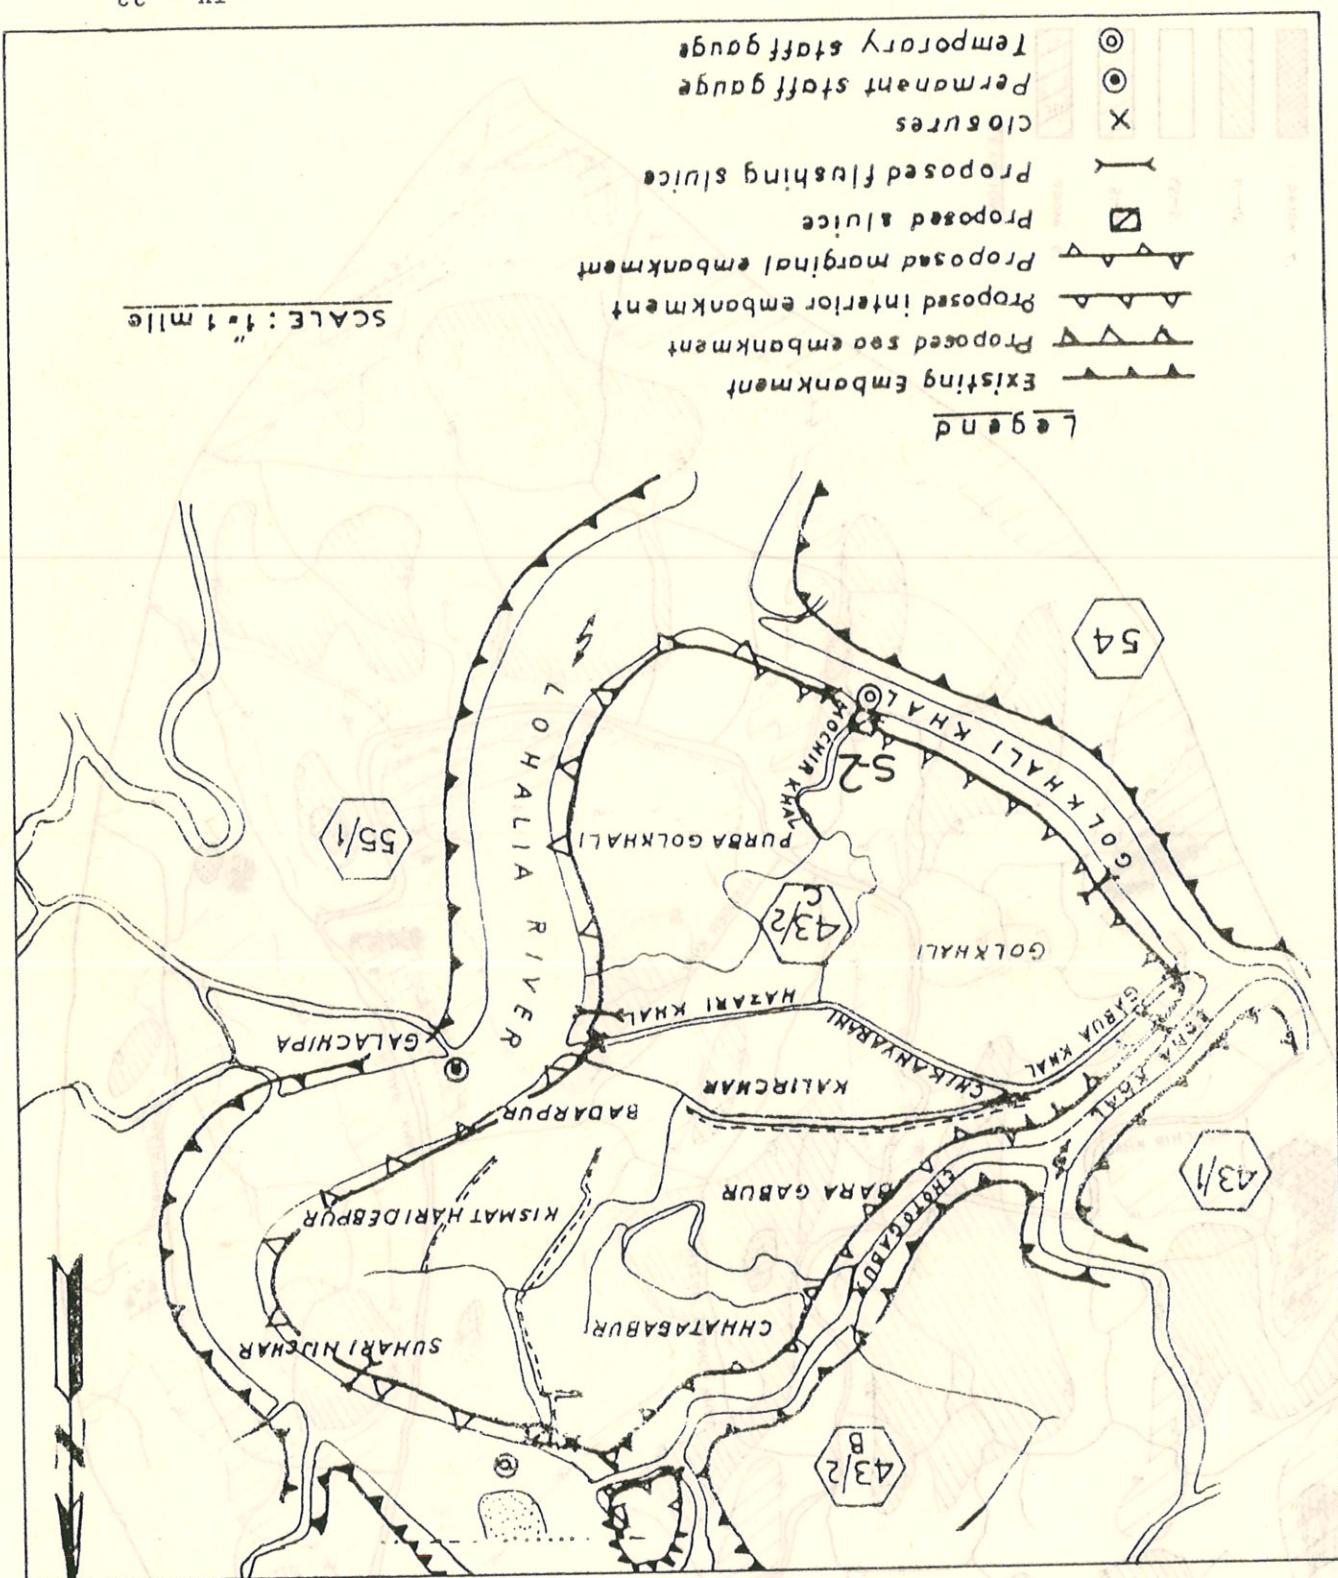

$$= 8.0 \text{ class at } 17.12 = + 5.20 \text{ m}$$

From the table it can be seen how many hectares can be irrigated with one 12" pipe for different water levels.

(LAST fortnight of June, first fortnight of July)

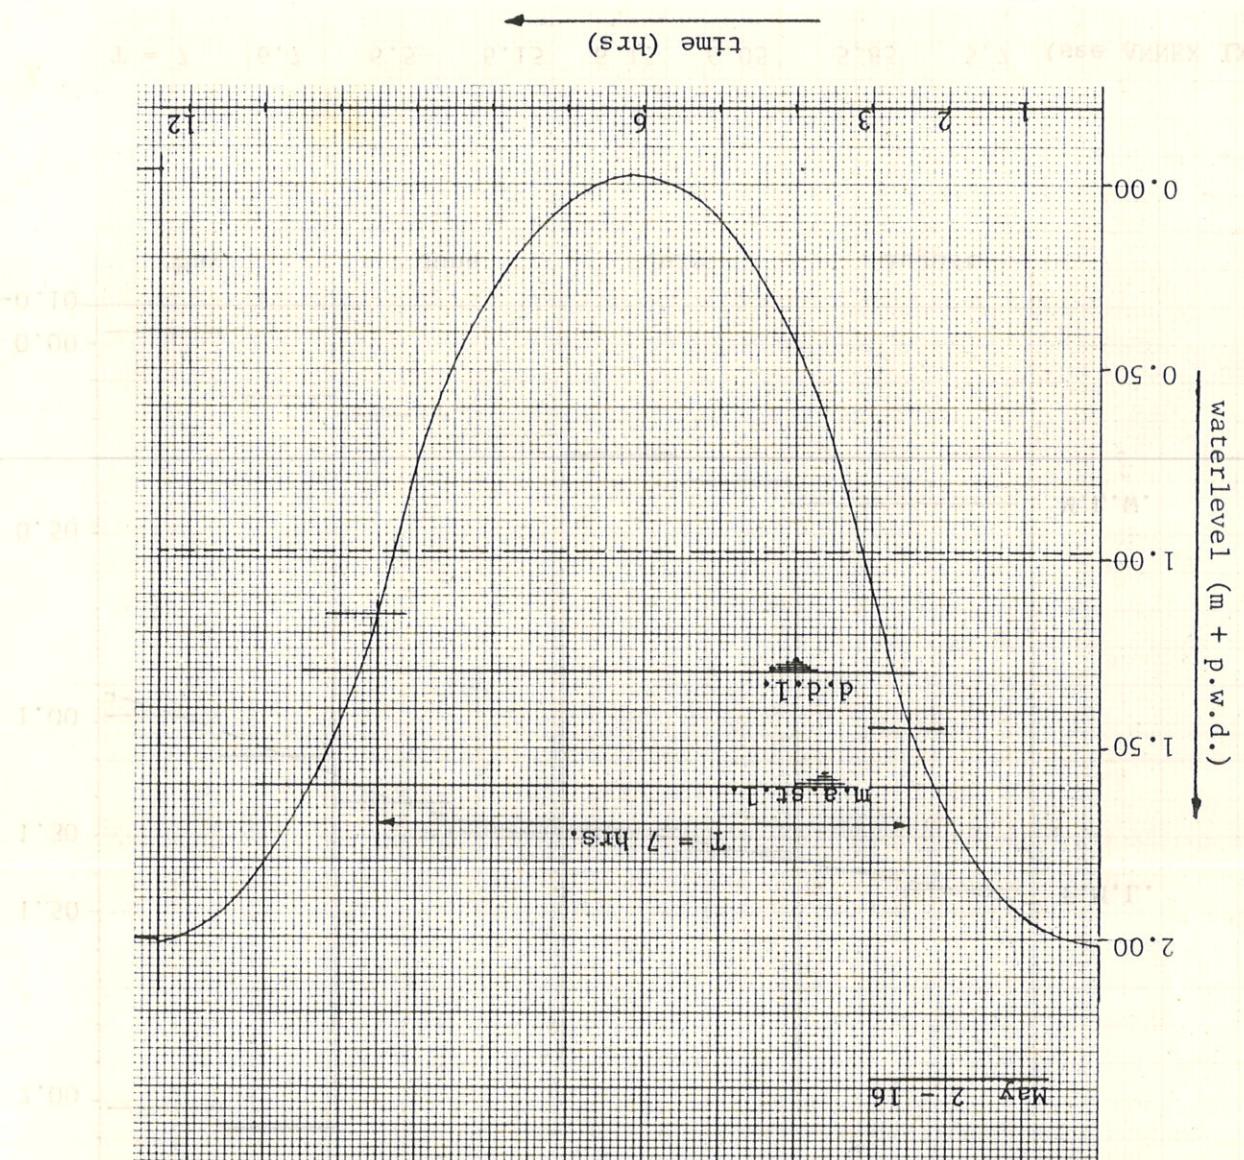

GOLDEN JACINTHES FOR GROWTH PLATES, WITH 5 MM X 5 MM

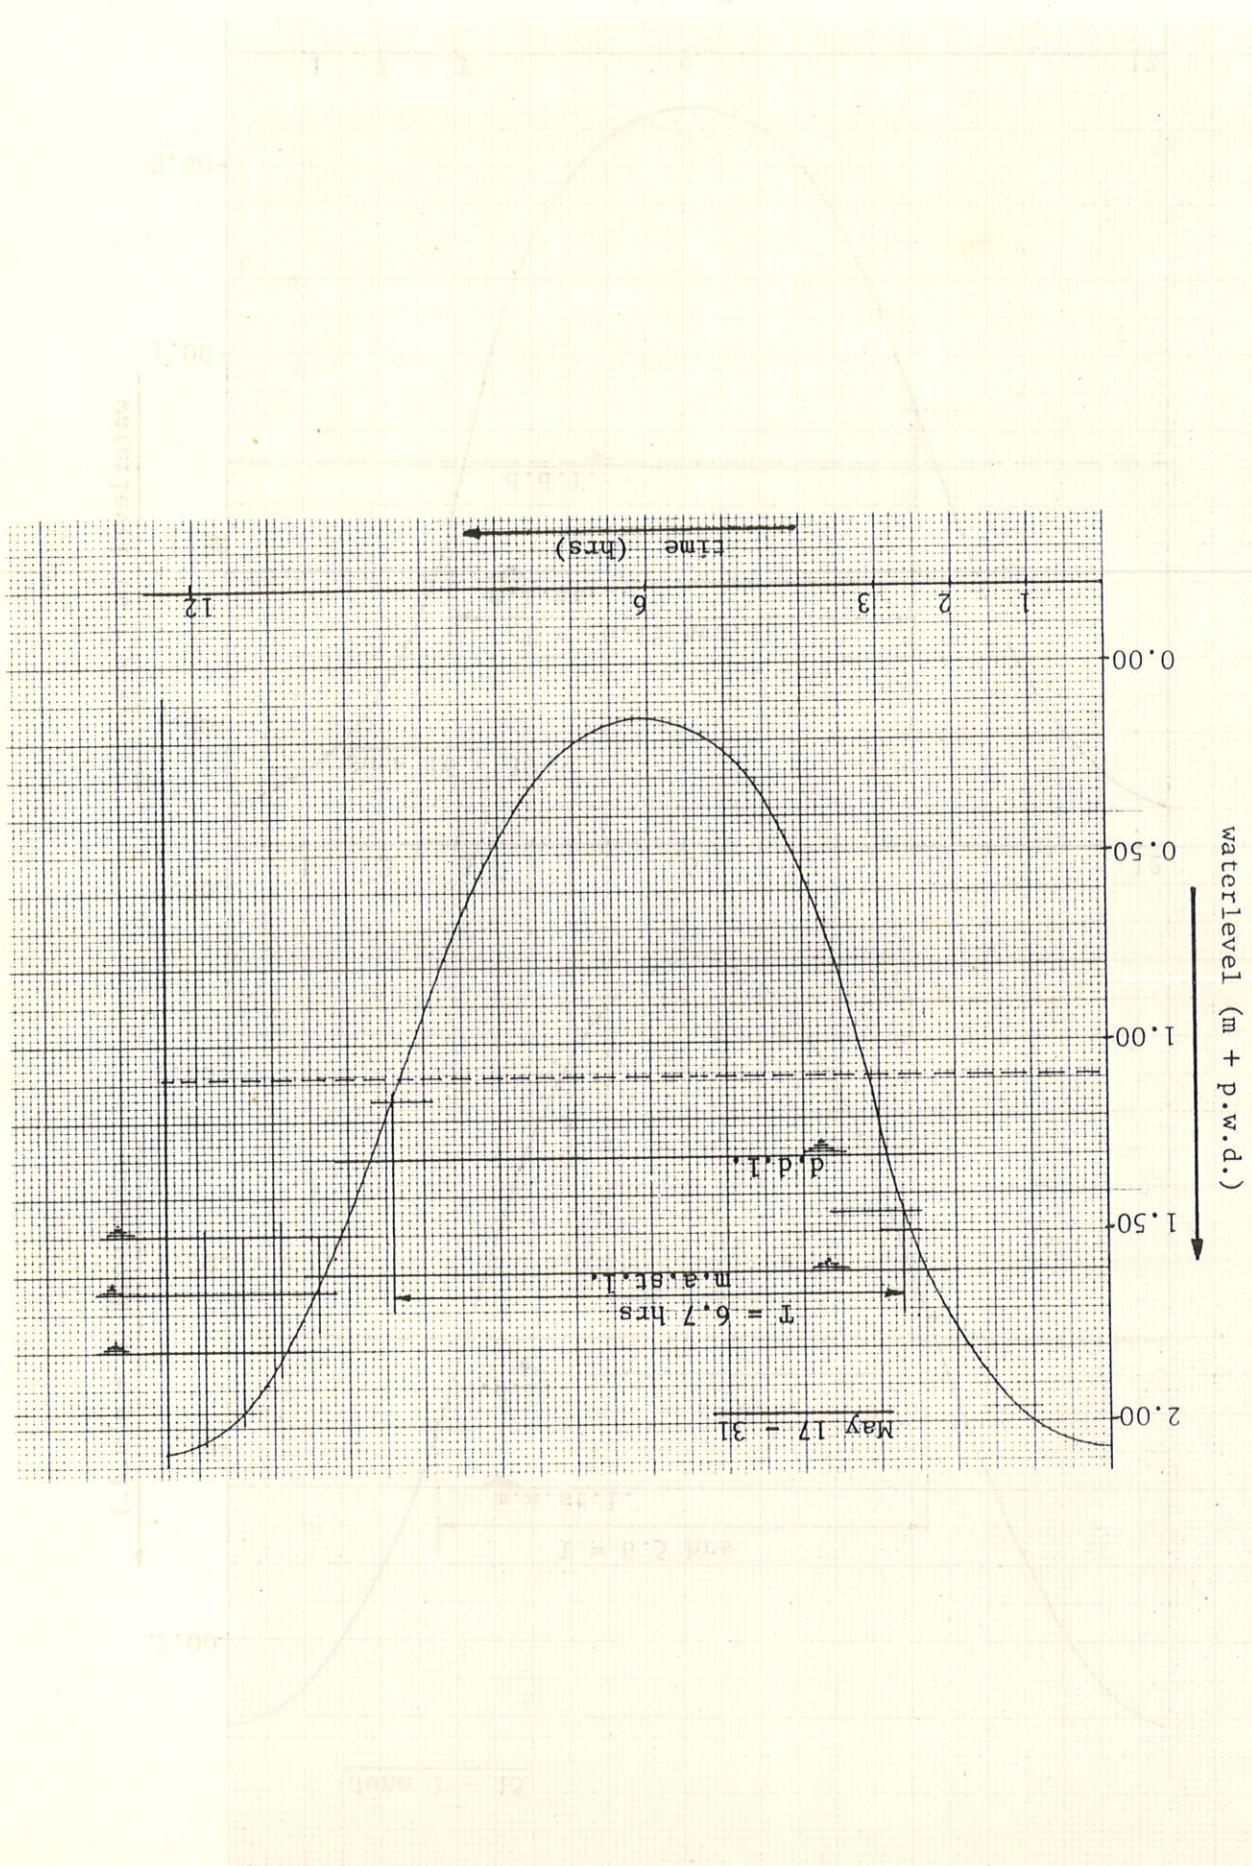

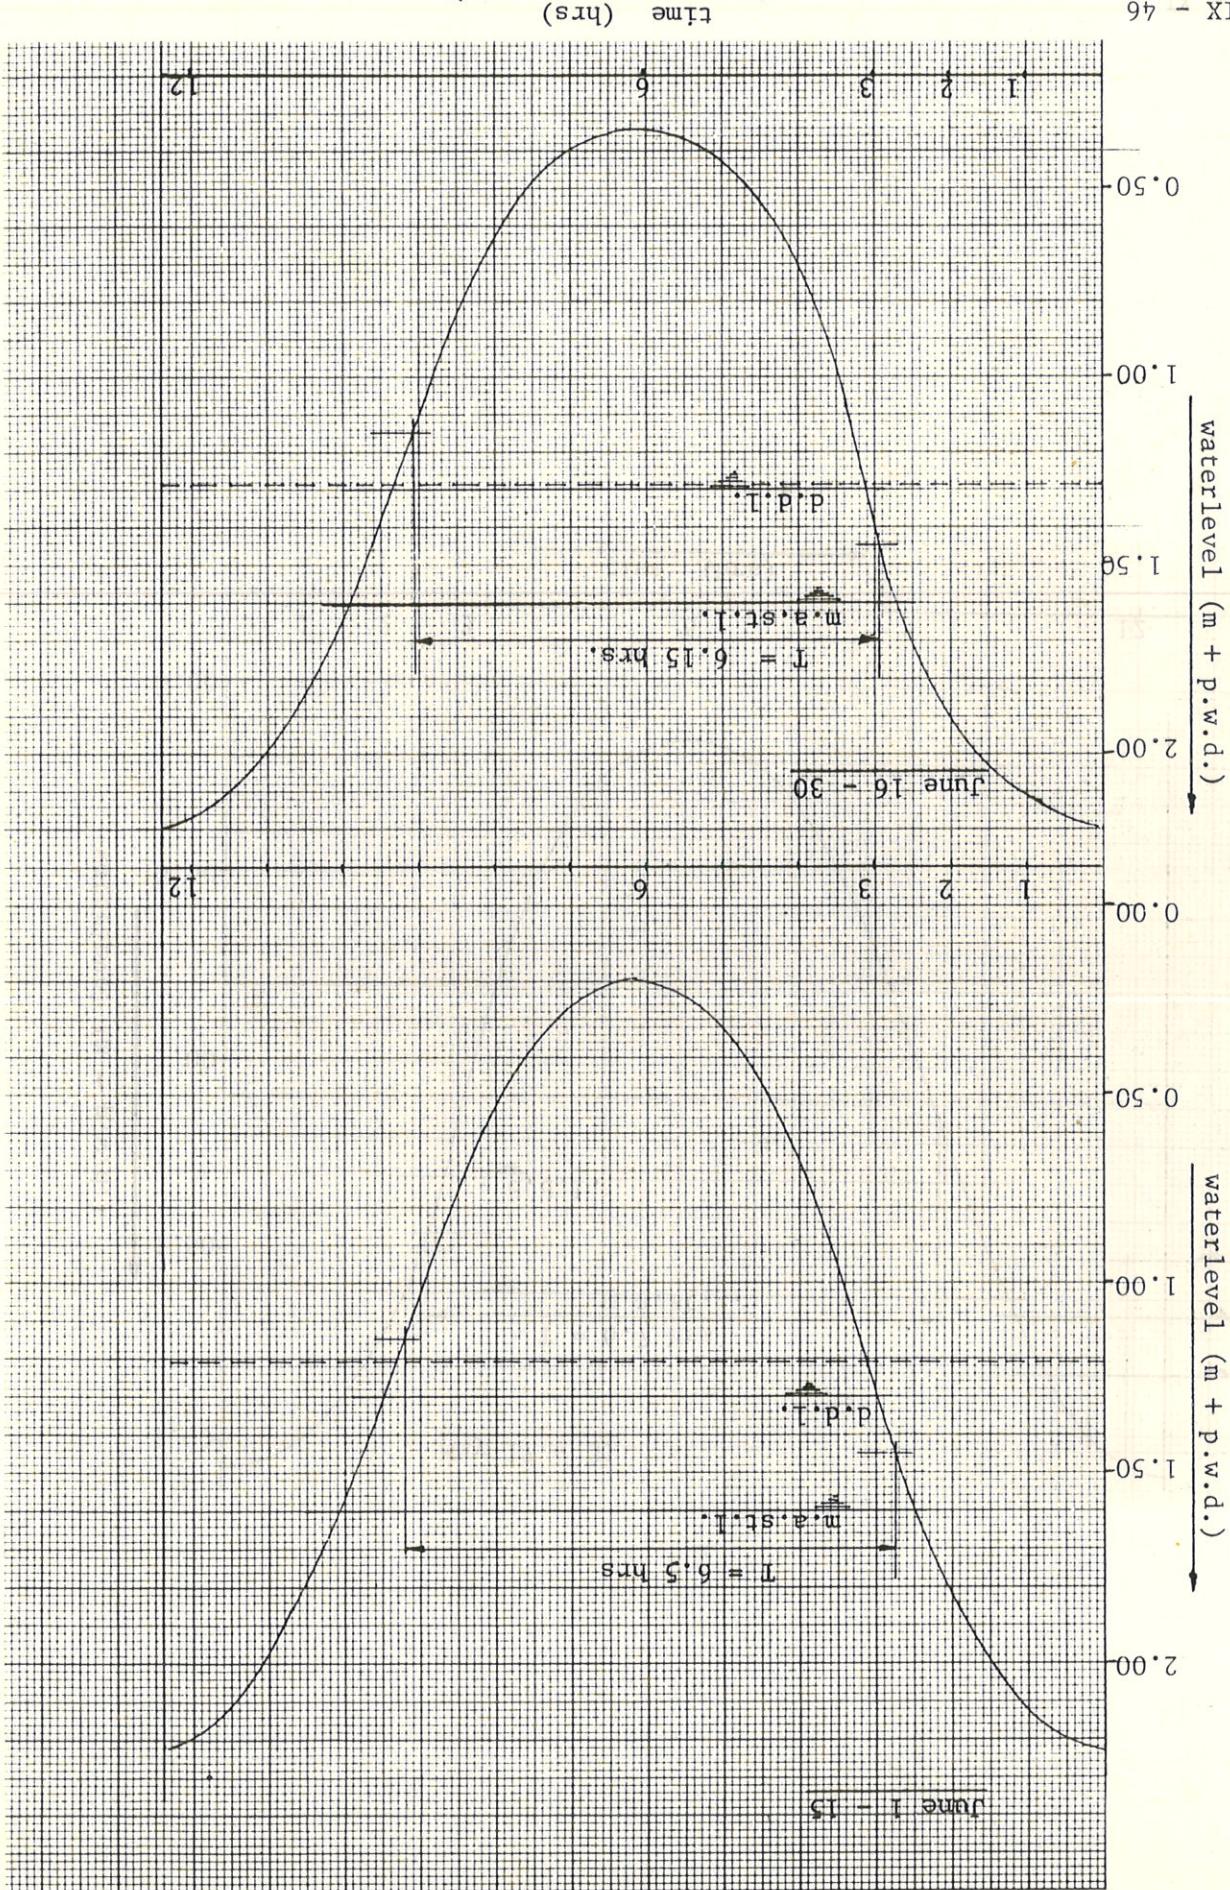

ANNEX IX - 9 AVERAGE TIDES DURING MAY - AUGUST

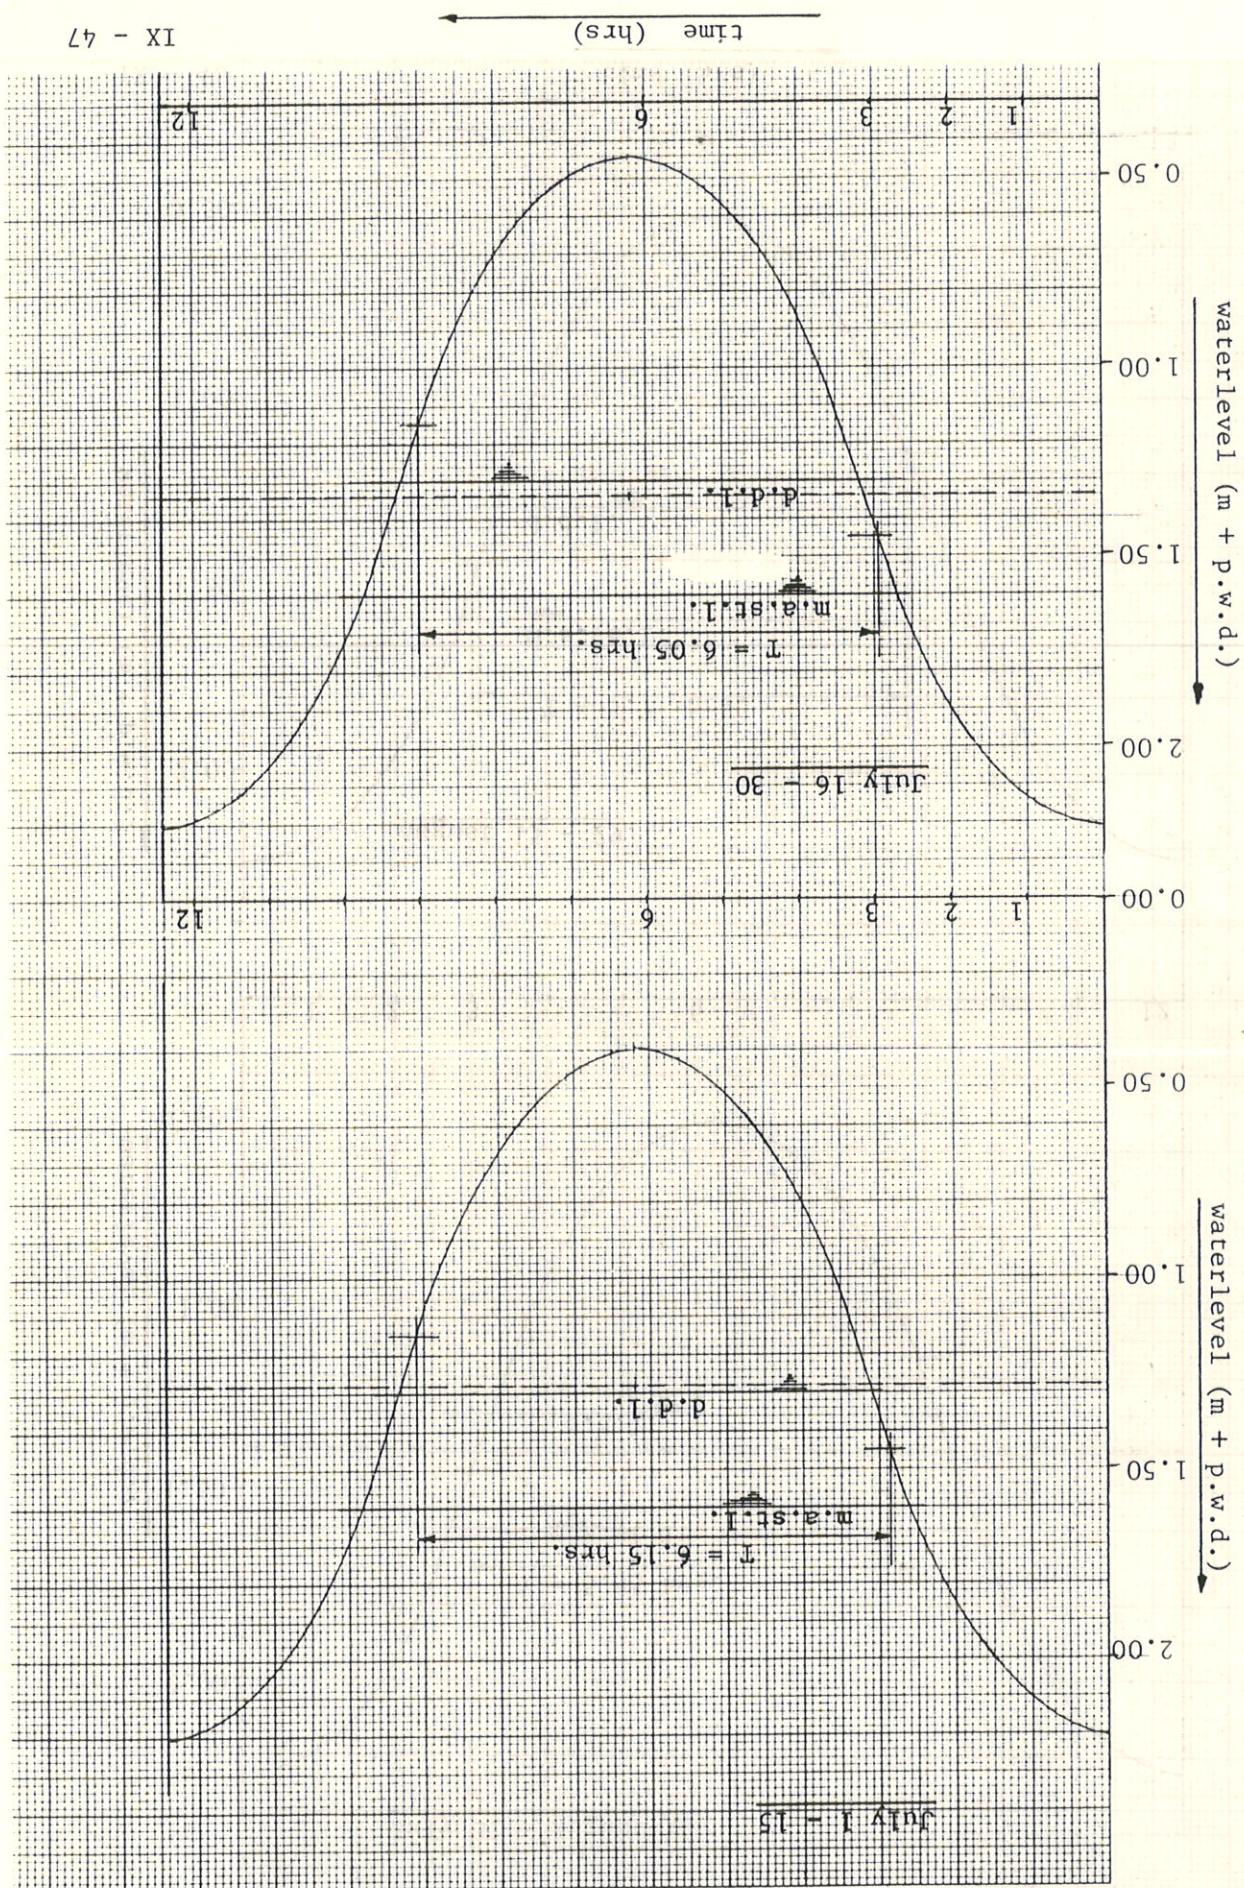

SEA LEVEL TIDES - IX EXHIBIT

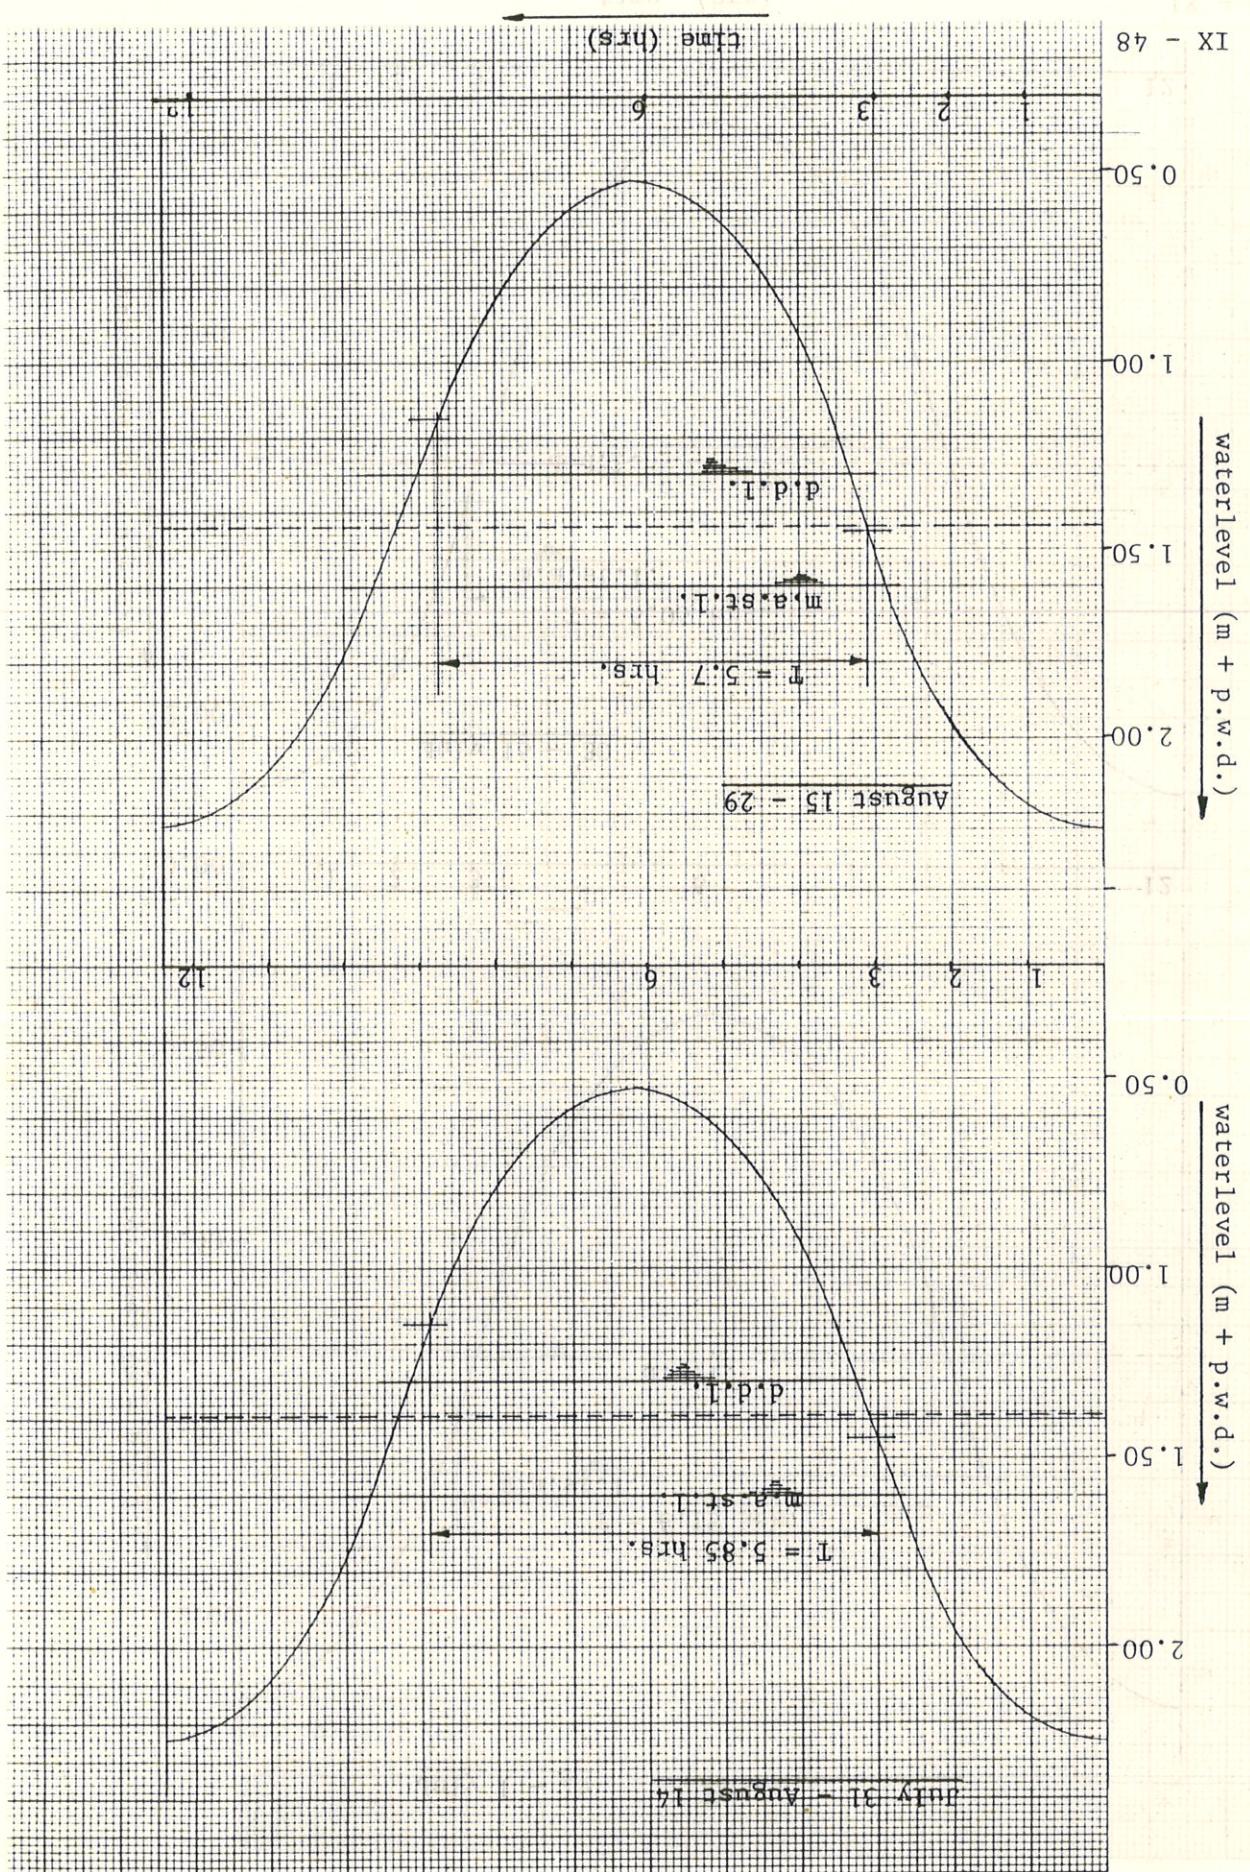

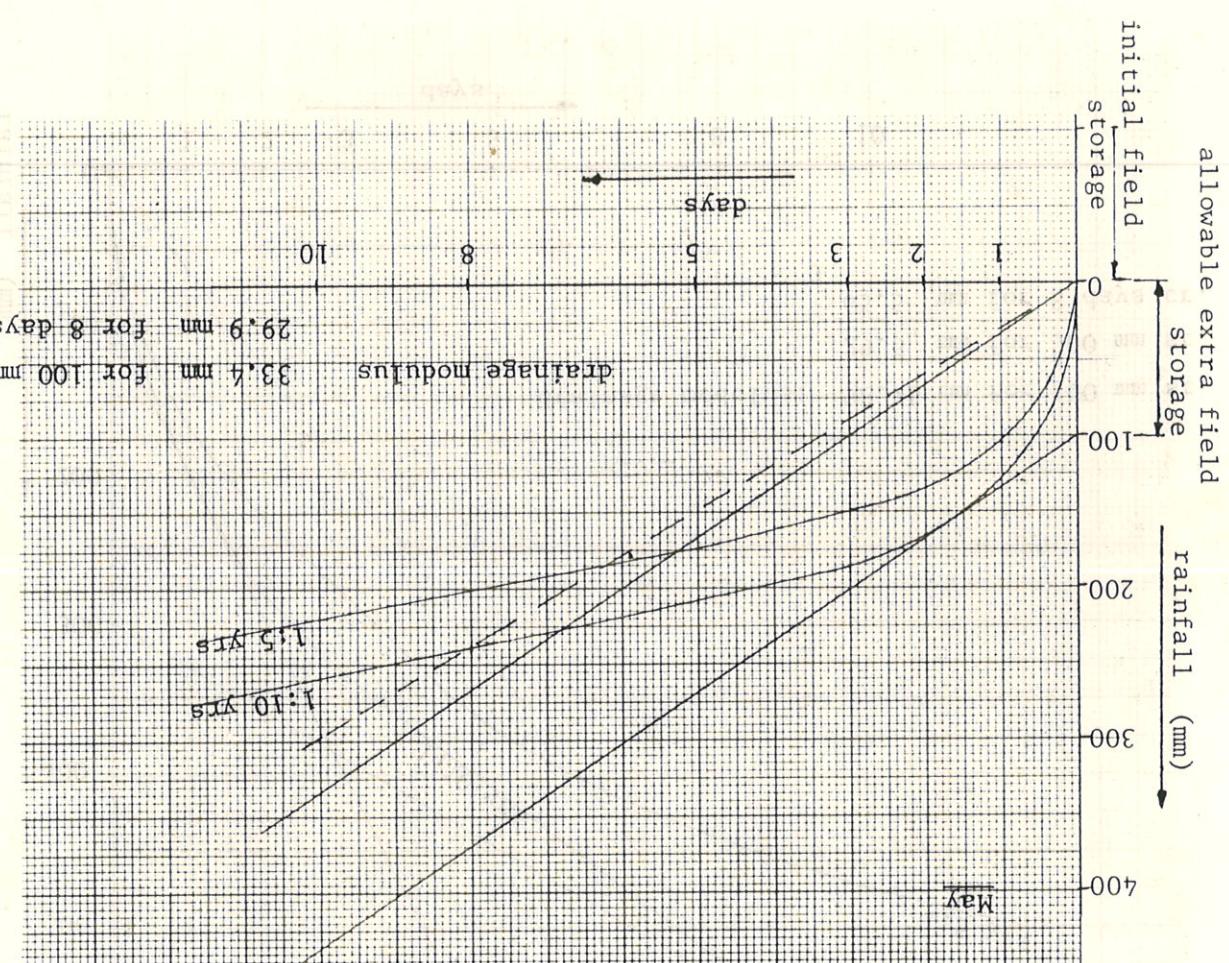

For the fortnightly periods during May - August and the determination of the drainage period T for the assumed d.d.l. (+ 1.30 m) and m.a.st.l. (+ 1.60 m).

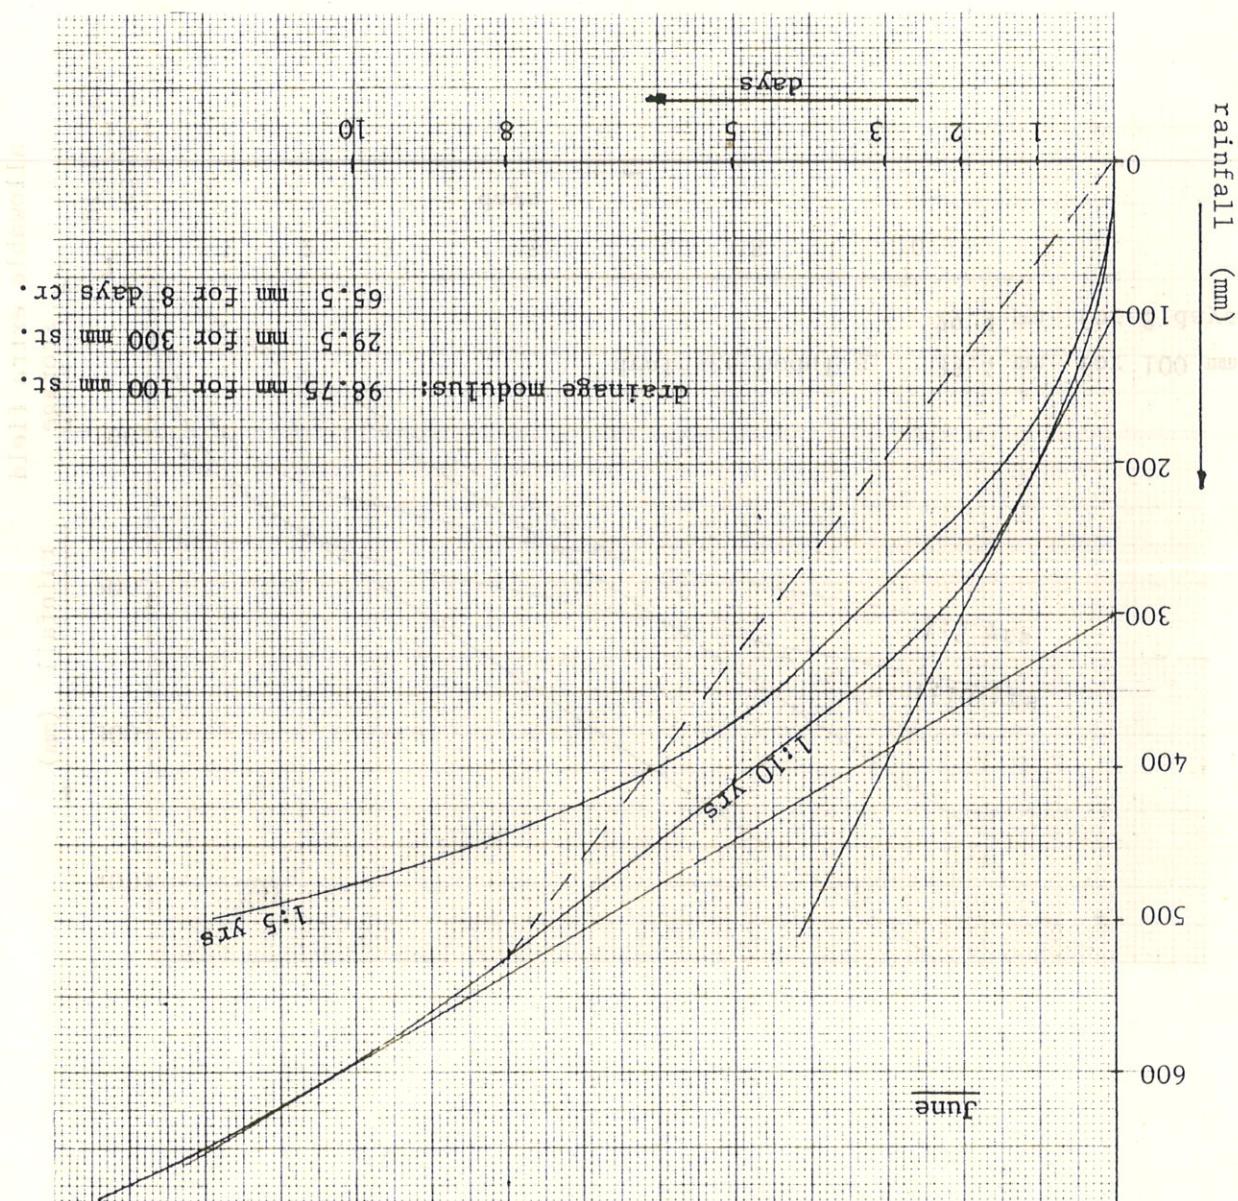

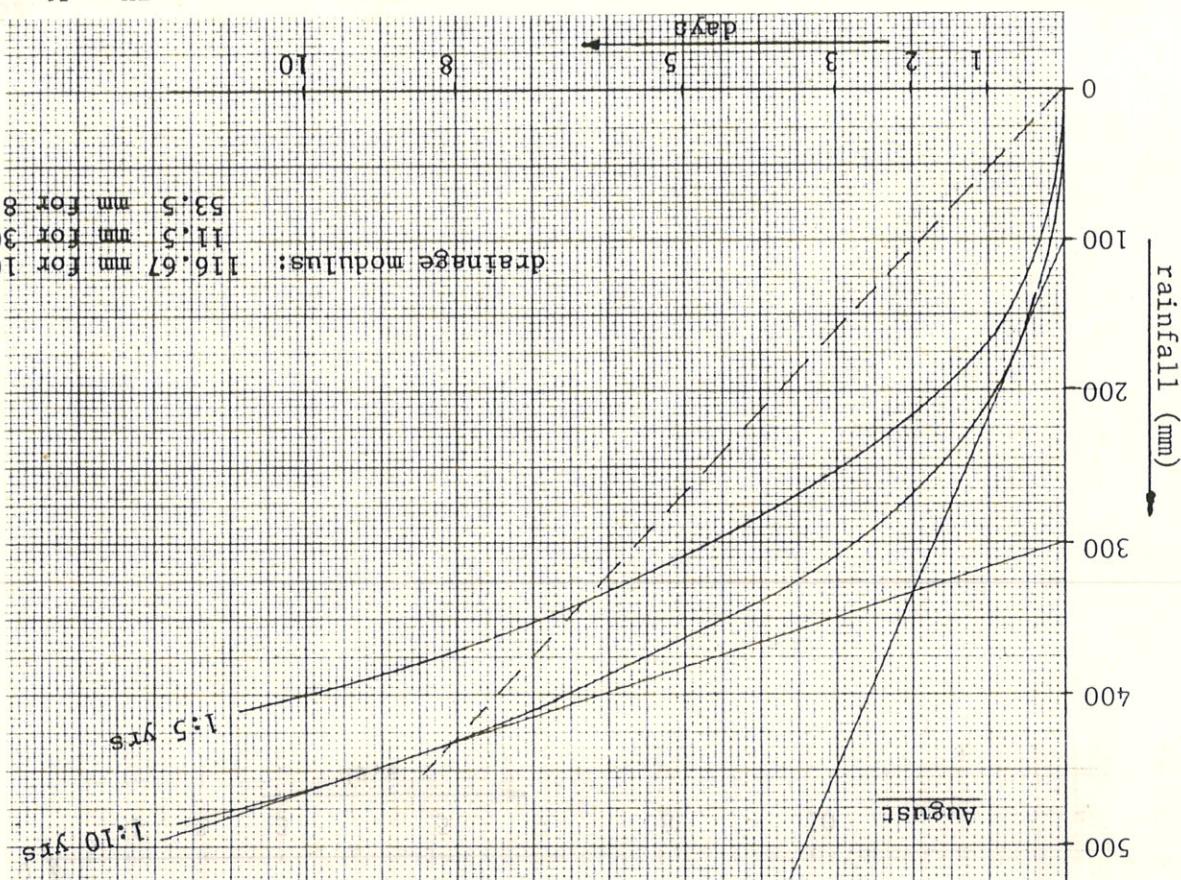

MODULUS

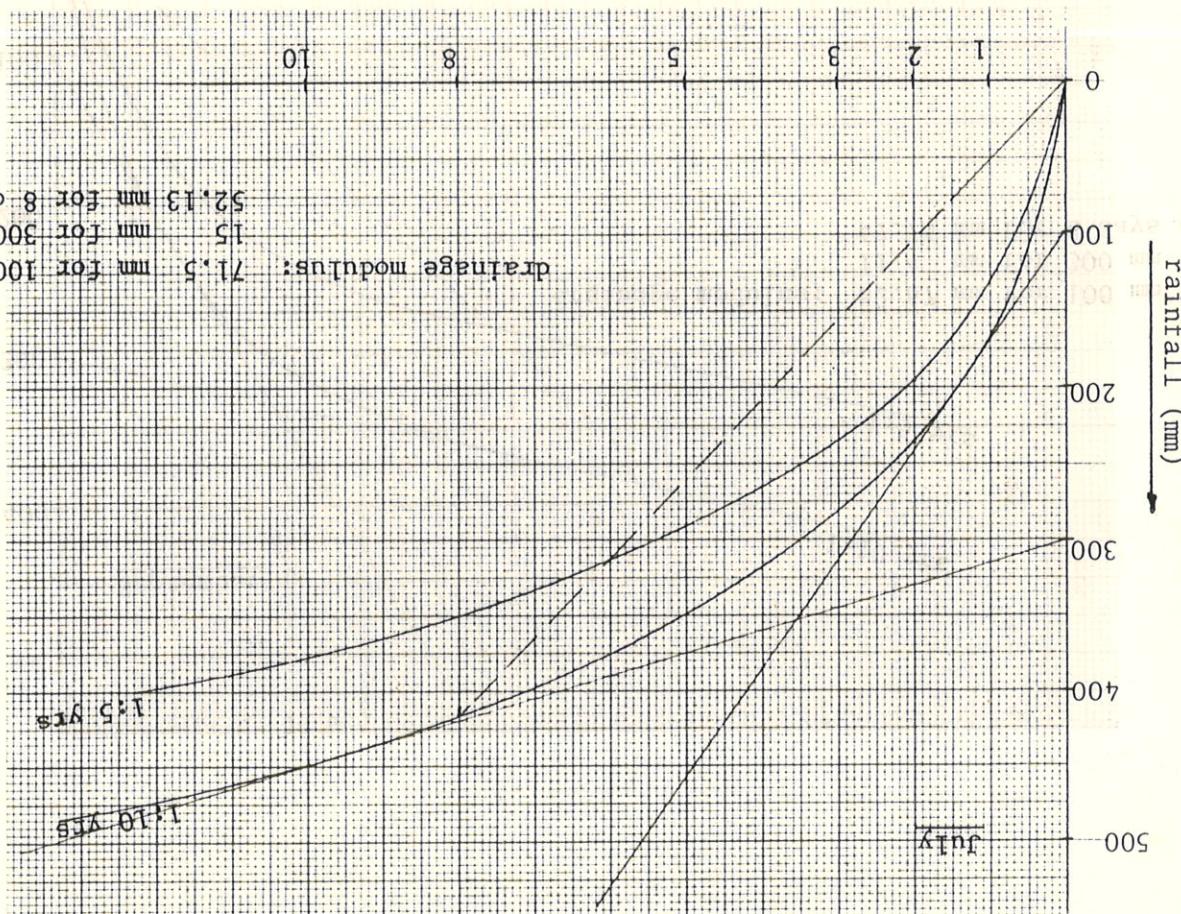

ANNEX IX - 11 RAINFALL DURATION CURVES DETERMINATION OF DRAINAGE

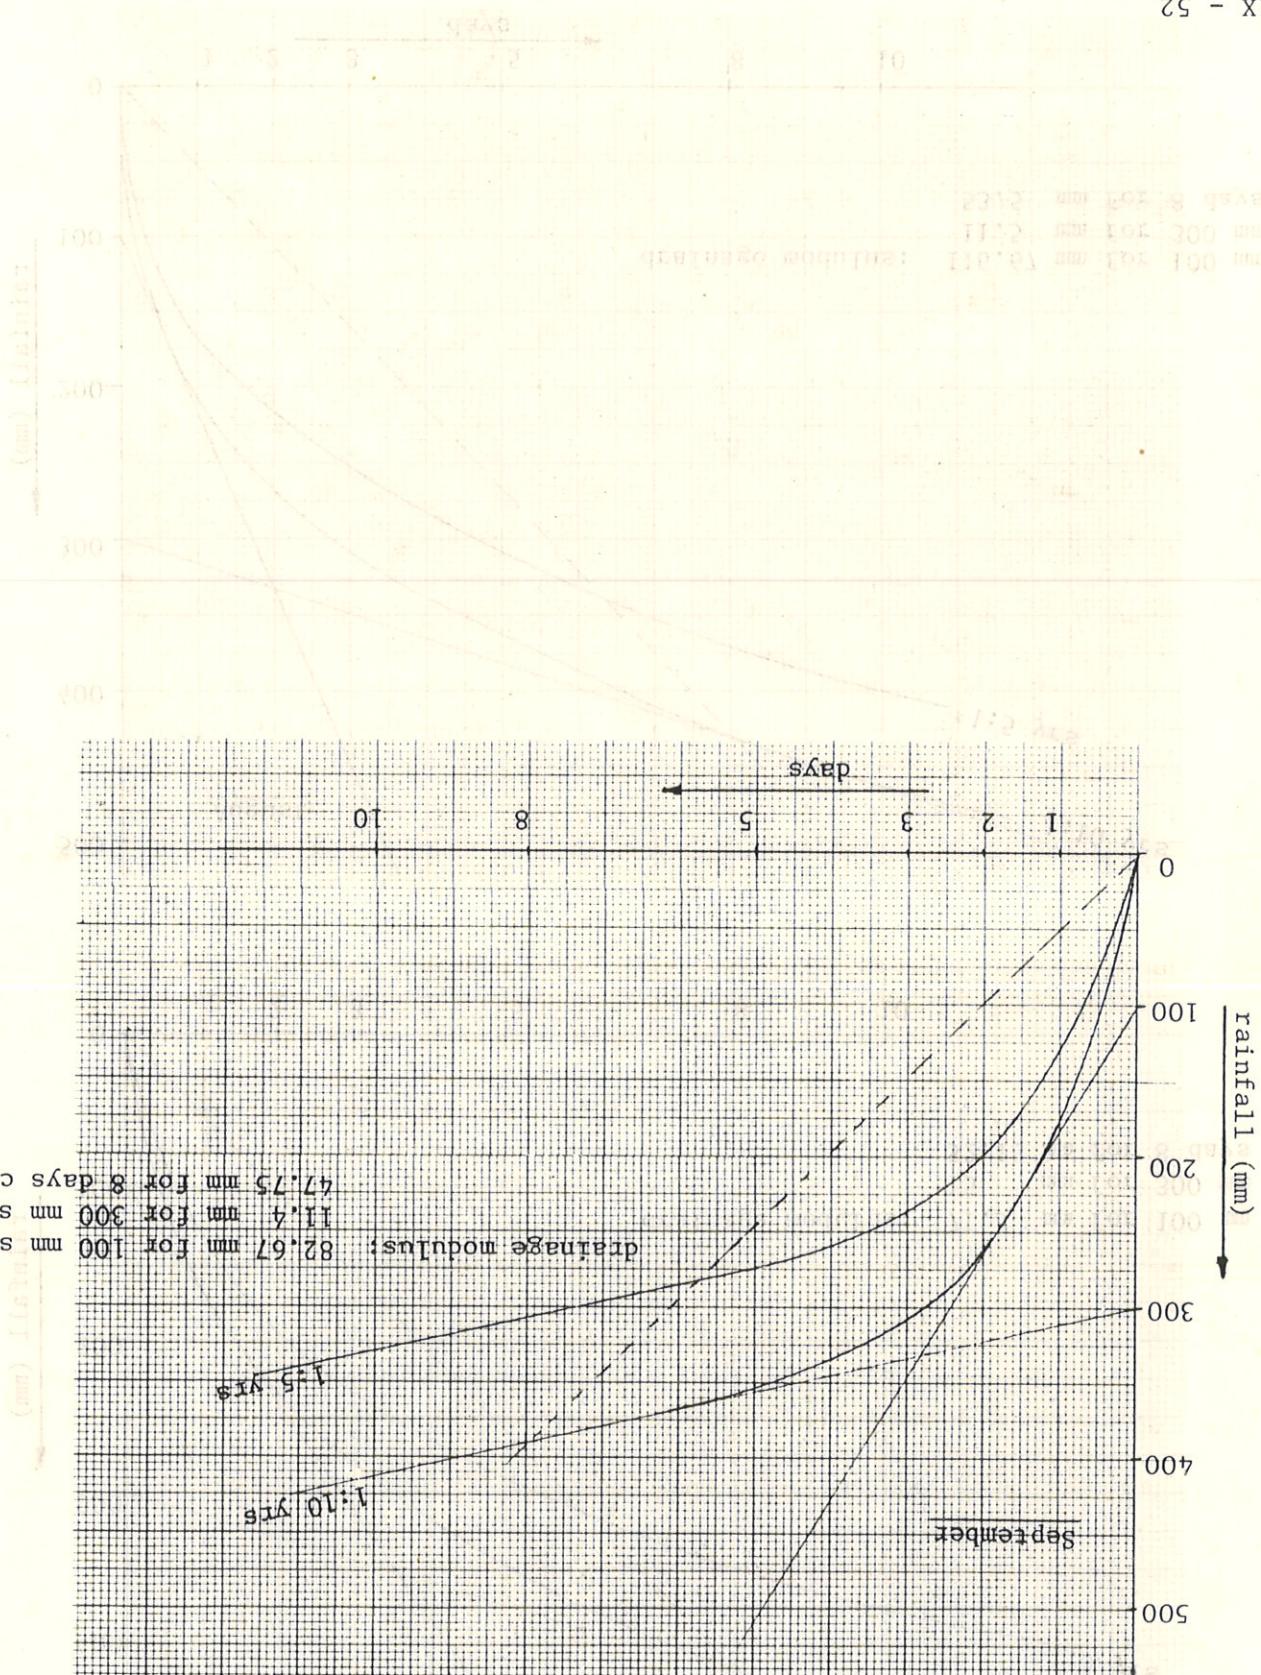

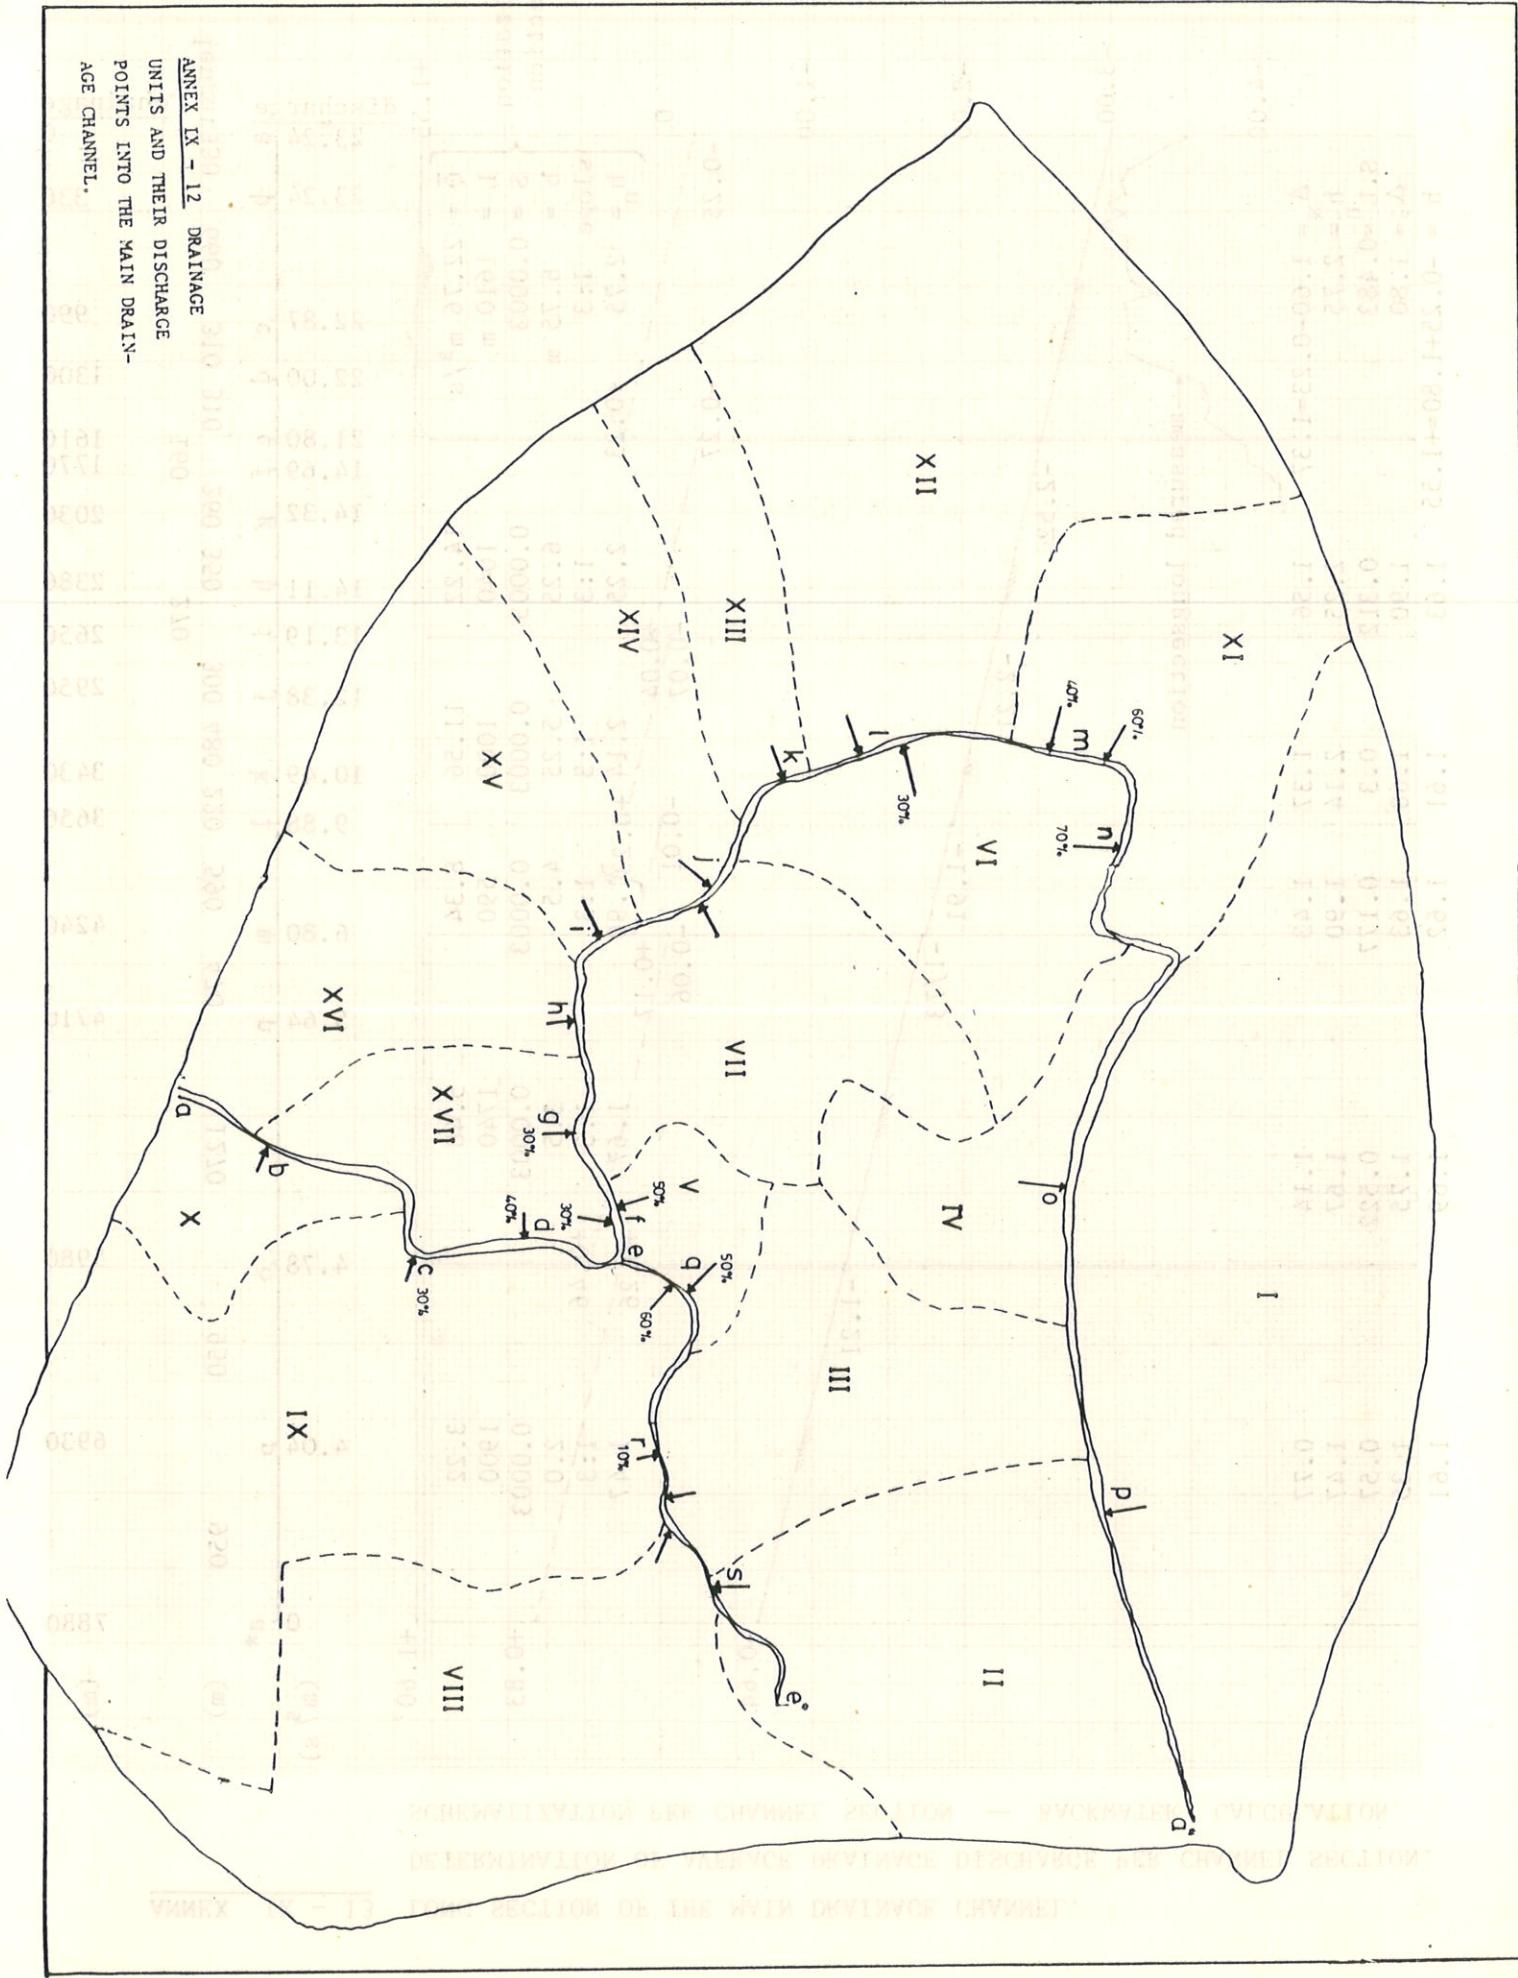

drainage modulus: 116.67 mm for 100 mm st.
 111.3 mm for 300 mm st.

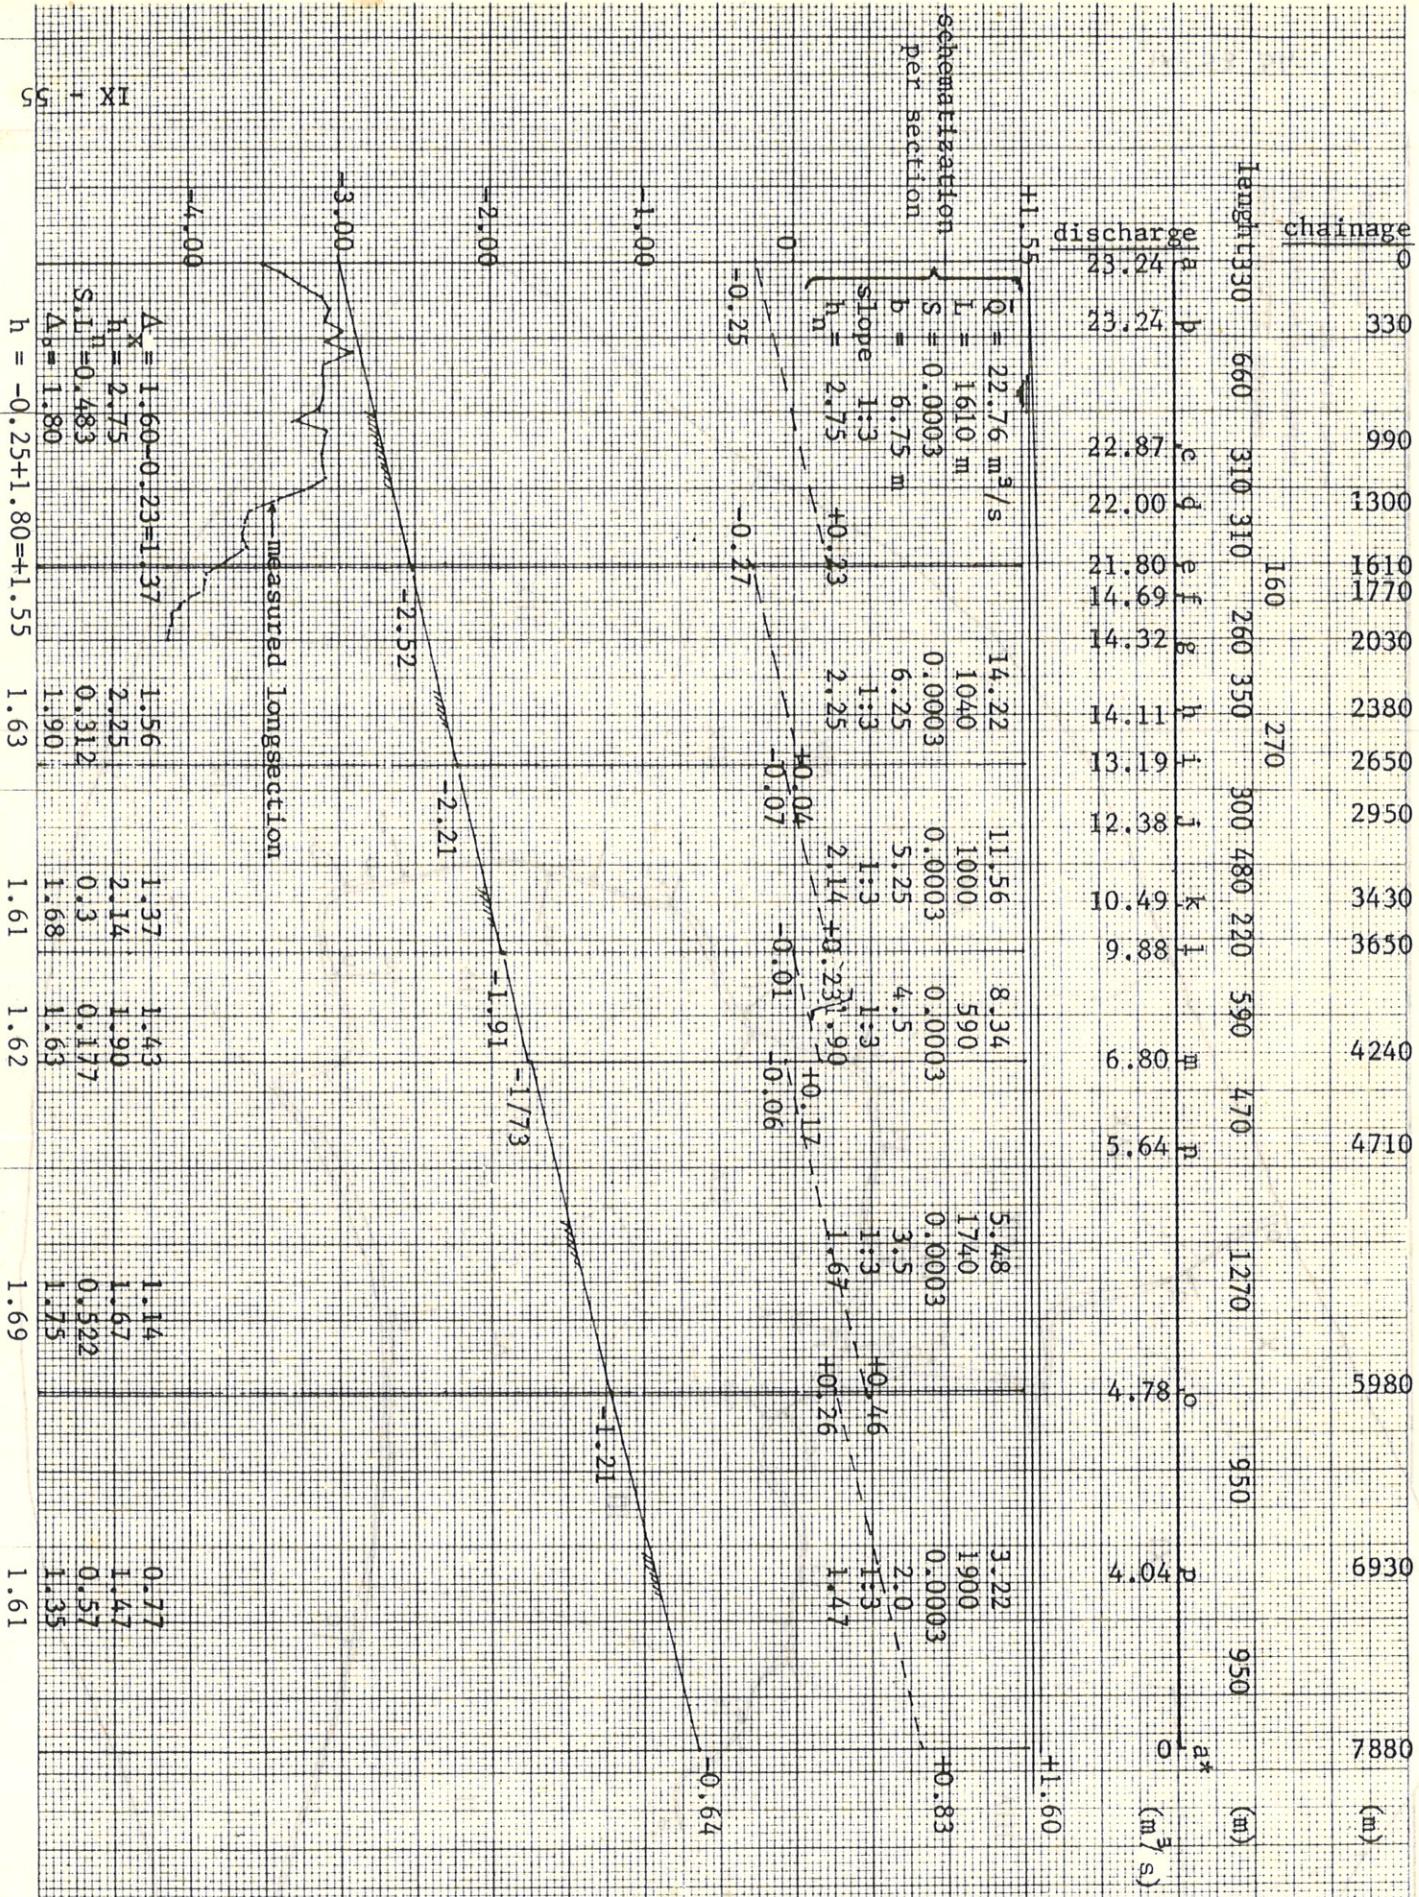

drainage modulus: 71.5 mm for 100 mm st.
 15 mm for 300 mm st.

DETERMINATION OF AVERAGE DRAINAGE DISCHARGE PER CHANNEL SECTION — BACKWATER CALCULATION.

DETERMINATION OF THE MAIN DRAINAGE CHANNEL SECTION.

LONG SECTION OF THE MAIN DRAINAGE CHANNEL.
